http://www.raspberrypi.org

#### 1 Introduction

Pi Presents is a multi-media presentation toolkit with animation control facilities. It was originally intended for Museums and Visitor Centres but has already found uses in hospitals, shops, schools, art installations, and libraries.

I am involved with a couple of charities that have museums or visitor centres. For several years I searched for a cost effective way to provide audio interpretation of exhibits and slide/video show displays for the reception area. Until the Raspberry Pi arrived buying or constructing something even as simple as an interactive audio player was expensive. The Raspberry Pi with its combination of Linux, GPIO and a powerful GPU is ideal for black box multi-media applications; all it needed was a program to harness its power in a way that could be used by non-programmers.

The Pi Presents toolkit currently supports five types of show commonly seen in museums and each of these can be configured to meet the your individual requirements. The toolkit includes a simple to use show editor running on the Pi or a Windows PC.

The toolkit allows construction of:

- A show for the animation or interpretation of exhibits by triggering a sound, video, or slideshow from a button, keyboard or other GPIO input.
- While playing media, GPIO outputs can be used to control external devices such as lights, moving machinery, animatronics etc.
- An automatic show for a visitor centre. Images, videos, audio tracks, and messages can be displayed. Repeats can be at intervals or at specified times of day.
- Automatic shows to be interrupted by the visitor and a menu of further content presented.
- A show for kiosks where content can be initiated by pressing one of a number of buttons.
- Facilities to construct shows commonly seen on touch screens in museums.
- It can be used to construct a 'powerpoint' like multi-media presentation where progress through slides is manually controlled by buttons or keyboard.
- It has facilities for basic remotely controlled digital signage with the ability upload image, video or audio tracks over a network for display in a repeating show.
- Run multiple shows simultaneously so that more than one exhibit can be controlled from one Pi or complex interactive exhibits can be controlled.
- Foreign language support.

There are potentially many applications of Pi Presents and your input on real world experiences would be invaluable to me, both minor tweaks to the existing functionality and major improvements.

Once set up Pi Presents is easy to use and does not require a network:

- Shows can be prepared using a simple to use editor on a Windows PC, the Pi, or another Linux box.
- Will operate on a Model A Raspberry Pi (but see hardware requirements).
- No need to modify the Pi's SD card after initial installation. All media and configuration options can be kept on a removable USB stick. Installing a new application is as simple as inserting the USB stick.
- Video output can use HDMI or composite selected using the normal Pi setup procedure. As Pi Presents can be started and shutdown without a keyboard a monitor is not required.
- Audio track output is selectable between HDMI and analogue and can be output from left, right or stereo speakers on a per track basis. A number of tracks can be played simultaneously to different speakers.

Pi Presents, out of the box, runs as a desktop application on the Raspberry Pi using the keyboard for control. However with a little bit of Linux magic, which is explained in this manual, it can be made to run as a black box application with control from GPIO. Black box features include:

- Disabling screen blanking and the mouse pointer.
- Full screen operation without window decorations
- Completely headless operation without a keyboard, mouse or buttons (except perhaps a shutdown button if you do not want to risk SD Card corruption)
- Black box control can be by buttons, PIR, or any source of digital inputs. It is straightforward to make your own controls.
- Mouse compatible touchscreens are supported if drivers are available for the Raspberry Pi. Alternatively a keyboard and mouse can be used. Pi Presents has been designed such that it is possible to add drivers written in Python for other forms of input and output such as RS232 and I2C.
- Automatic start up when power is applied to the Pi
- Safe shutdown without using keyboard or mouse
- Automatic shutdown of the Pi at a specified time of day.

### 1.1 Acknowledgements

Johannes Baiter (jbaiter) for pyomxplayer based on Noah's pexpect

Numerous people on the Raspberry Pi forum and websites, particularly StackOverflow, who have unwittingly provided me with solutions to many technical problems and taught me Python.

Icons from <a href="http://www.fatcow.com/free-icons">http://www.fatcow.com/free-icons</a>

The Raspberry Pi Foundation for the first affordable machine that plays video, audio and has GPIO.

Having been introduced to open source software through the Raspberry Pi I was amazed at the time and effort which so many people put in to produce software for others, so I thought it worthwhile to do the same with Pi Presents. I am glad I did because the feedback I have had from users and potential users has given me so many good ideas for extensions to Pi Presents. Needless to say I have been so busy producing Pi Presents that I have not had time to use it for my own intended projects, however one day I am sure I will  $\odot$ .

#### 2 Installation

The installation instructions are in the README.md file. Pi Presents is aimed at the latest Foundation Raspbian release and should be installed and run from the LXDE desktop.

# 3 Try Some Examples

Download the examples from the pipresents-examples github repository as described in the README.md file.

From a terminal window opened in the pipresents directory type:

```
python pipresents.py -p pp mediashow 1p2
```

You will see a continuous looping show in a small window. The small window is useful for development purposes; you can adjust its size by delving into the python code as described in Section 15. You can expand the display to nearly full screen by using the appropriate window decoration. If however you want to see the show truly full screen without borders then use the -f command option:

```
python pipresents.py -p pp mediashow 1p2 -f
```

The mediashow example and all the other examples are designed for a 1920\*1080 display. If you have a smaller resolution display some of the text and part of the larger images will disappear off the edges of the display. Pi Presents does not automatically adjust for screen resolution; you will need to use the Pi Presents editor to adjust text font sizes, and to resize images external to Pi Presents.

The pipresents-examples repository has examples of how to use Pi Presents:

# pp\_mediashow\_1p2 The profile you have just run. The show will start immediately, progress automatically, and repeat after 200 seconds. Use the Up and Down cursor keys to skip tracks.

# pp\_menu\_1p2 Use the Up and Down cursor keys to traverse the menu, Return to Start a track, and Escape to terminate it.

#### pp\_exhibit\_1p2

This demonstrates how to trigger a mediashow from a PIR. When started, the screen will be blank. Triggering the PIR input (opening a contact connected to 0 volts on P1-11) or pressing a button (closing a contact connected to 0 volts on P1-18) will start a one shot mediashow and then wait for another trigger.

It uses a gpio.cfg in the profile which has pins P1-18 and P1-11 bound to the symbolic name PIR. This name is then associated with Trigger for Start in the mediashow.

The example uses the Return key as a trigger in addition to the GPIO inputs so you can see the effect without using the GPIO pins. If you wish to disable this then set Disable Controls to yes.

BEWARE: Do not use the GPIO pins until you have read Section 9.4

#### pp interactive 1p2

This combines a mediashow and a menu. The mediashow is run continuously but every track has a hint showing that a menu can be triggered by the Return key. Pressing Escape from the menu returns to the mediashow.

#### pp\_presentation\_1p2

The mediashow is configured as a presentation. Use the Return or Down Cursor keys to start the presentation and the Up and Down cursor keys to traverse through it. Escape stops a running video and waits.

#### pp\_liveshow\_1p2

While the Liveshow is running place some video files, audio files, html files, or images into the directory /home/pi/pp\_home/pp\_live\_tracks and watch them miraculously appear.

# pp\_radiobuttonshow\_1p2

A Radiobuttonshow controlled either from the keyboard or GPIO pins.

Links defined in the Radiobutttonshow profile allow for both keyboard keys and buttons to be used to select a track. In addition a gpio.cfg file is included in the profile to bind four GPIO pins to entries and one to the Stop Internal Operation.

pp\_hyperlinkshow\_1p2

This demonstrates the features of the hyperlinkshow. The show is controlled by on screen buttons which you can click with a mouse. It should ideally be used with a touchcreen but I do not have one to try. The file screen.cfg defines the buttons and the symbolic names of their input events. The show could be controlled by GPIO pins by binding pins to the symbolic names in a gpio.cfg file.

#### pp\_audio\_1p2

This mediashow demonstrates the capabilities of the audioplayer. You will need speakers connected to hdmi and analogue ports to fully appreciate it. It plays tracks to different speakers; it also demonstrates the use of Run-Time controls to control volume from keyboard or GPIO pins. For this reason it has controls.cfg and gpio.cfg files in the profile,

#### pp\_web\_1p2

A demonstration of the web browser capabilities. Ideally an internet connection is required. The profile contains keys.cfg and controls.cfg which enables the zoom level of the browser to be controlled with the I and s keys. It is necessary to click on the background image first.

#### pp\_concurrent\_1p2

This application demonstrates concurrent show playing capabilities. There are two mediashows running simultaneously. The mediashow showing images must be controlled from the keyboard while the concurrent mediashow containing audio tracks has its controls disabled and is played continuously.

#### pp\_subshow\_1p2

Demonstrates how to use subshows to segment a larger show.

#### pp timeofday 1p2

Triggers two mediashows at different times of day. To make this demonstration work I have replaced the times of day with delays (+xx). You can replace these delays with real local times e.g. 10:30.

#### pp\_plugin\_1p2

Demonstrates the operation of plugins. Some of the examples require an internet connection. Before using the liveshow copy the .cfg files from the /media directory in the examples to the /live\_tracks directory.

#### pp\_showcontrol\_1p2

Demonstrates the use of Show Control to start and stop one concurrent show from another.

#### pp\_animate\_1p2

Demonstrates the use of Animation Control by setting P1-11 to On at the start of a track and to Off at the end. To achieve this it has its own gpio.cfg file. BEWARE: Ensure P1-11 can safely be used as an output before running this.

#### • pp\_shutdown\_1p2

A mediashow that demonstrates how to use Show Control to shut down the Pi It displays a message track and then when the Down Cursor is pressed starts a track that shuts down the Pi immediately.

You can use the bash script examples.sh to execute the examples, just type ./examples.sh from a terminal window open in the /pipresents directory. You will need to make examples.sh executable.

All examples use a selection of media tracks which are in /home/pi/pp\_home/media. The profiles are in /home/pi/pp\_home/pp\_profiles. In each profile the pp\_showlist.json file specifies the look and feel of each show; other files specify the media to use. The files can be viewed in a text editor but it is much better to edit them using Pi Present's own editor described in Section 4.

The 'out of the box' keyboard commands are:

- Up or Down Cursor- move through a menu.
- Up or Down Cursor Move through a mediashow show. Can also be used to skip to the next or previous track in an automatic mediashow. The movement circles around at the start and end of a show.
- Return Start a presentation or play the selected menu entry.
- Escape In a track, Stop and return to the show. In a show, back to the calling show.
- Spacebar in an image, video, or audio track, toggle pause.
- CTRL-BREAK always exits Pi Presents.

# 3.1 Terminating Pi Presents and Shutdown the Pi

Out of the box pressing CTRL-BREAK or clicking on the 'Close' icon always exits Pi Presents. Pressing the GPIO pin bound to the shutdown function for 5 seconds will shutdown the Pi, See Section 9.7

There are other ways to exit Pi Presents:

- Some keyboards do not have a BREAK key; it is possible to configure another key to exit Pi Presents by editing the keys.cfg file to bind another key to pp-exit as described in Section 10.2.3.
- Bind a different key, GPIO pin, or click area to the special symbolic name ppexit as described in Section 10.2
- Use the Show control 'exit' command to exit Pi Presents from within a show, See Section 6.4.3

There are other ways to shut down the Pi from Pi Presents:

- The default operation of pressing a button for 5 seconds is by binding a GPIO pin to the special symbolic name pp-shutdown. See Section 10.2.1. Only a pin can be bound to pp-shutdown as it needs to be asserted for 5 seconds as an anti-tamper measure.
- Bind a key, pin or click area to the special symbolic name pp-shutdownnow as described in Section 10.2. An input event with this symbolic name will cause the Rasperry PI to shutdown immediately.
- Use the Show control 'shutdownnow' command to shut down the Pi immediately from within a show, See Section 6.4.3

#### 4 The Pi Presents Profile Editor

Profiles can be created and edited using the Pi Presents editor.

```
python pp editor.py
```

When using the editor you will need to supply show references, track references and file names. It is advisable not to create names beginning with pp- or pp\_ to avoid clashes with names used by Pi Presents.

## 4.1 Using the Editor

#### 4.1.1 The Displays

Select one of the example profiles using the Profile>Open menu. Gotcha: On a Linux system remember to open the selected profile directory before pressing OK.

- The top left panel displays the shows in the profile
- The bottom left panel shows the medialists in the profile, click on one of the entries to select it.
- The right-hand panel shows the tracks in the selected medialist.

The selected entries are shown in red. Click the 'Edit Show' button adjacent to the left-hand panel to edit the selected show and the 'Edit' button adjacent to the right-hand panel to edit the selected track.

Edits are saved to disc when OK is pressed, use Cancel if you want to duck out.

You can run pipresents.py and pp\_editor.py concurrently from two terminal windows so the effect of any edits can quickly be seen. You will need to restart pipresents.py to see the updates made by the editor. If you are going to edit the examples first make a copy of them by using the File Manager to access /home/pi/pp\_home/pp\_profiles and to copy a profile directory.

#### 4.1.2 Profile Menu

Profile>Open - displays a directory viewer to select a profile for editing. The profiles displayed are those in the home directory defined in the Options>Edit menu.

Profile>Validate - Validate the Profile. Font and Colour fields are currently not validated and if you edit the .json files with a text editor you are on your own!

Profile>New from Template - lists templates for all types of show. The templates have example tracks so they will run un-edited but some are missin configuration files.

#### 4.1.3 Show Menu

**Show>Add** - Add a new show and a medialist with the same name. The show type of an existing show cannot be edited.

**Show>Copy To** - Copy the show, creating an empty medialist for the show

**Show> Edit** - Duplicates the Edit Show button

**Show>Delete** - Deletes the show from the profile, no going back!

#### 4.1.4 Medialist Menu

**Medialist>Add** - Add a new medialist. The .json extension is added if not included.

**Medialist>Delete** - Deletes the medialist from the profile, no going back!

#### 4.1.5 Track Menu

#### Track>Add from File

Adds one or more track entries containing media files to the end of the medialist. These may be images, videos or audio tracks. The editor automatically calculates the file location and track type. If either of these is unacceptable or the media file extension is rejected then use Track>New to add a blank track of the required type.

The list of extensions that are used to select track type is in the first few lines of the pp\_definitions.py source. Please raise a bug report if these are inadequate.

#### Track>Add from Dir

Similar to Add from File, except that all eligible tracks in the directory are added to the medialist.

The list of eligible extensions that is used to select tracks and their types is in the first few lines of the pp\_definitions.py source. Please raise a bug report if these are inadequate.

#### Track>New

Adds a blank track of the selected type to the end of the medialist.

#### Track>Edit

**Duplicates the Edit Button** 

#### Track>Delete

Deletes the track from the medialist, no going back!

#### 4.1.6 Tools Menu

#### Tools>Update All

Update the version of all profiles in the current data home directory, see Section 13. If you wish to see which profiles are being been updated then run the editor from a terminal window using the -d option.

#### 4.1.7 Options Menu

#### Options>Edit

Edit the editor options:

Pi Presents Home Directory

This is an important option which must be set to the directory in which any profile directories and relative media is to be assembled. Out of the box it is set to /home/pi/pp\_home. If you choose an alternative setting for this then ensure that the directory /pp profiles is created inside the chosen /pp home.

#### Initial Media Directory

This is just a helper setting to define where 'Add Track' and 'Add from Dir' start their browsing.

#### 4.1.8 Editor Command Line Options

-ddebug	Run time errors give alerts and are reported to the terminal window if open. Turning on debugging will in addition provide a trace of the operation of the editorin the terminal window.  Errors and the trace are also recorded in the /pipresents/pp_log.log file.
forceupdate	Update a profile even if the editor and profile issues are the same (for beta testers only)

# 4.2 Making Profiles

Application data is kept is a directory called /pp\_home. /pp\_home must contain a directory /pp\_profiles in which profiles are stored.

A profile is a directory which contains the information needed to configure a single application of Pi Presents. It must contain a pp\_showlist.json file and one or more medialist (.json) files. The pp\_showlist.json file contains a number of sections, a 'start' show section and a number of sections each defining a user generated show Each section in the pp\_showlist.json file defines the look and feel of a show and how they link together. Medialist (.json) files in a profile define the content each show and some per track look and feel information.

For portability reasons all media is best kept under the directory /pp\_home, but this is not essential. Media can be stored anywhere under the /pp\_home directory using sub-directories if necessary.

The default location of /pp\_home is /home/pi; this will need to be overridden by command line options if you are using a USB stick. There is a /pp\_home directory in the /pipresents directory, but this should not be used as it contains the templates for the editor and 'out of the box' configuration files.

#### 4.2.1 Making Profiles Portable

I wanted to produce a system where profiles and their media can be moved between different drives without breaking the references between shows and their media tracks. This is necessary if a profile is prepared on a Pi on a SD card and moved to a USB Stick for operational use; also if the profiles are to be prepared on a Windows machine.

To achieve portability media tracks should be stored under the /pp\_home directory, in sub-directories if desired. If tracks are copied to this location before the profile is prepared then the Profile Editor will automatically compute the appropriate track reference:

- If the file is below the home directory (...../pp\_home), as defined in the
   Options>Edit menu then the file reference will look like '+/track\_to\_play.mp4'
- Otherwise the reference will look like '/home/pi/mymedia/track\_to\_play.mp4'; an absolute reference.

Absolute references do have their uses, for example in specifying internet url's e.g. http://www.mysite.com/ track\_to\_play.mp4

#### 4.2.2 Using the SD Card for Profiles

This is very useful for developing applications on a Pi. To use the SD card for developing and running profiles

- Create a directory /pp\_home in the User Pi's home directory and inside that create a directory called pp\_profiles. You can also create a directory in /pp\_home called say, media, to hold media files.
- In the Editor Options set the Pi Presents Data Home directory to /home/pi/pp\_home and the Initial Directory for Media to /home/pi/pp\_home/media
- Copy media files to the /media directory
- Using the editor create a new profile, call it myprofile, and edit it.
- To run the profile type:

python pipresents.py -p myprofile

from a terminal window open in the pipresents directory.

When running Pi Presents using sudo, from a desktop shortcut, or from an autostart file it is best to specify the full path of pipresents and also the full path of the data home directory e.g.

sudo python /home/pi/pipresents.py -o /home/pi -p myprofile

## 4.2.3 Using the Editor on a Windows PC

Use on a PC requires a Python system to be installed. I use the free Activestate Python <a href="http://www.activestate.com/activepython">http://www.activestate.com/activepython</a>. There is a good installation guide here <a href="http://www.richarddooling.com/index.php/2006/03/14/python-on-xp-7-minutes-to-hello-world/">http://www.richarddooling.com/index.php/2006/03/14/python-on-xp-7-minutes-to-hello-world/</a>.

To install the editor on a Windows PC download the Zip File from <a href="https://github.com/KenT2/pipresents-next">https://github.com/KenT2/pipresents-next</a> (just click on the Zip button). Extract the contents of the folder pipresents-next-master to a folder called pipresents.

Either download pipresents-next-examples and extract the folder to your top level folder (c:\users\ken on my Windows 7 machine) or create a 'pp\_home' folder here with a folder 'pp\_profiles' inside.

Open pp\_editor.py in the Idle editor and run it. Alternatively you can double click on pp\_editor.py or create a desktop shortcut to pp\_editor.py; you may need associate '.py' files with python.exe.

Use of the editor is the same as on the Pi, it is obviously important that all track references are to media files under pp\_home.

Profiles created on a PC can be transferred to the Pi using a USB Stick, alternatively you can ftp them across a network using a PC ftp program such as Filezilla or WinSCP.

#### 4.2.4 Using a USB Stick for Profiles

To run profiles from a USB stick copy /pp\_home to the top level of a USB stick from its location either on a Pi or on the PC.

Insert the USB stick into a Pi and run Pi Presents with the -o option set to /media/STICKNAME. STICKNAME is the drive name. Wiindows seems to convert lowercase drive names to upper case.

The editor will probably run on any Linux PC. If you are using such a beast you probably do not need your hand held when transferring profiles.

# 5 The Components of Pi Presents

#### 5.1 Introduction

#### **Shows and Tracks**

The Pi Presents toolkit has two building blocks - shows and tracks.

A show plays tracks; the list of tracks to be played is contained in a medialist which is associated with the show, think of the medialist as an enhanced playlist.

The toolkit currently has five types of show each optimised for a different purpose:

- Mediashow plays a sequence of tracks, usually automatically, but progress can be manually controlled.
- Hyperlinkshow Implements the touchscreen functionality that you see in many museums.

- Radiobuttonshow A simple kiosk show showing a navigation screen press one of many buttons to play a track.
- Menu Similar to a Radiobuttonshow but the track selection is by traversing a menu using 'cursor' keys or a single button.
- Liveshow A Mediashow like show with dynamic remotely sourced content.

The toolkit currently has 'players' for four types of track each playing a different type of media. All 'players' allow the main media to be displayed in a window with an optional background of plain colours, images, and text annotations. They allow animation to be controlled and for other concurrent shows to be started and stopped.

- video plays videos using omxplayer
- audio plays audio tracks using mplayer
- image displays images in many different formats (.jpg etc.)
- message a quick way to display text.

#### **Subshows and Child Shows**

In Pi Presents a show can be a track of another parent show; this is called a subshow. Subshows have a number of uses which include:

- Dividing a long mediashow into segments. Each segment is a show and a parent mediashow contains the segment shows in its medialist.
- A menu or radiobutton show might have mediashows as entries rather than single tracks
- Multi-level menus

Subshows can be nested to any depth, the limit is probably the confusion that it will cause the customer when using them. Sub-shows are tracks so appear in the medialist.

Child shows are subshows used in a special way by mediashows and liveshows. If child shows are enabled (Has Child) the child show can be initiated while running any track in the parent show returning to the next track in the parent when finished.

#### **Concurrent Shows**

Pi Presents can run two or more shows concurrently. The concurrent shows appear to run in parallel. This has many uses which include:

- Providing a background audio track to a slideshow.
   Use two mediashows, one with the slideshow and the other with the audio tracks. The latter will need the controls disabled if there is customer interaction with the former.
- Running shows at specific times of day

Use two or more liveshows or mediashows each triggered at time of day. The liveshow and mediashow can also be stopped at a specific time of day or after a period of time.

 Being really thrifty and doing two completely different tasks with the same Pi, perhaps a slideshow in the Reception and a dummy talking in a museum exhibit triggered by a PIR

Each concurrent show can have subshows.

Pi Presents can be configured so that each concurrent show/subshow stack has its own set of controls.

# 5.2 Types of Show

Shows have fields which control the sequencing and look of the show. They also have a number of fields which provide default values for all the tracks in the show e.g. Duration, Transition, OMXPlayer Audio; tracks will use the values in the show if their corresponding fields are left blank.

All shows have the following fields:

- Title Text displayed in the editor and in the entries of a menu show
- Show Reference A label which allows other shows to reference this show.
   Can be any alpha-numeric string without spaces.
- Medialist this is the name of a file which appears in the medialist panel. It
  must have the extension .json. Every show must have a medialist to define
  the tracks in the show. The same medialist can be used by more than one
  show.

#### 5.2.1 Mediashow

Think of a mediashow as a slideshow that can play tracks of different types - videos, audio tracks, images, and even animation control sequences.

Mediashows have a number of fields to define the control of the show, e.g. Trigger for Start, Progress, Repeat and Repeat Interval.

A show can be associated with a mediashow such that the show is accessible from any track in the show. These are termed 'child shows'. The Has Child field tells Pi Presents that a show is associated with the show; the child show itself is referenced in the medialist for the show. Associated with the use of a child show is Hint Text that is displayed only when Has Child is yes.

Mediashows have a number of options in the Repeat field which control how they run:

- interval the mediashow repeats until it is stopped.
- oneshot The mediashow waits for Trigger For Start runs once and then waits for Trigger For Start again. It has to be stopped by some other means.

 single-run - the mediashow runs once and then stops by itself. It does not need to be stopped although it can be. Show Control Stop commands sent to a show that is already stopped are ignored. Mainly for use with Show Control

Immediately after starting all a mediashow consider conditions for continuing:

 Mediashows with Trigger For Start = start will run immediately. Mediashows with Trigger For Start = input, or time will proceed when the trigger condition is met

There is more information on the control of mediashows in Section 6.2.1

Field	Examples	Values
		Essential information
Туре	mediashow	Cannot be edited
Title	My First Show	Text describing the show displayed in the editor
		and on menus
Show	show1	A 'label' by which the show is referenced by
Reference		other shows. Any text without spaces
Medialist	mymedia.json	Filename of the medialist file containing the
		tracks for the mediashow.
Show		Not used
Canvas		
		How the show is to be run
Disable	no	yes/no
Controls		If 'yes' Internal Operations (play, pause, up,
		down, stop) and Run Time controls are disabled.
		This is a quick way to inhibit all controls for a
		concurrent show. For more selective control use
		the Controls field (See Section 6.4)
Trigger For	start	How the media show proceeds after it is started:
Start		<ul> <li>start - continue without a wait</li> </ul>
		<ul> <li>input/input-quiet - wait for an input event.</li> </ul>
		'input-quiet' suppresses on screen
		messages.
		<ul> <li>time/time-quiet - wait for a time of day.</li> </ul>
		'time-quiet' suppresses the next show
		message.
Trigger Input	PIR	If Trigger For Start is 'input' or 'input-quiet':
		A symbolic name that is bound to an
		input event as described in Section 10.2
		If trigger is 'time':
		A list of times of day h:m:s in 24 hour
		format separated by spaces. (See
		Section 6.2.1)
Progress	auto	How the show progresses between tracks:
		<ul> <li>manual - Pi presents will wait for up/down</li> </ul>
		internal operations between tracks.
		<ul> <li>auto - tracks play continually, up/down</li> </ul>
		internal operations can be used to skip.

Field	Examples	Values
Trigger For	continue	If Progress is manual how to trigger the next
Next		track
		input - wait for an input event
Novt Input		continue - do not wait  If Trigger For Next is 'input'.
Next Input		If Trigger For Next is 'input':  A symbolic name that is bound to an
		input event as described in Section 10.2
		input event de decembed in ecclient 16.2
Sequence		sequence of tracks:
		<ul> <li>ordered - played in the order of the</li> </ul>
		medialist
		shuffle - play tracks in a random order
		There is no natural end to a shuffled set of tracks
		so it will be necessary to use Trigger For End if
		the show is to be terminated.
Repeat	interval	How the media show is repeated:
		<ul> <li>oneshot - tracks are sequenced once and</li> </ul>
		then the show waits for a start trigger.
		interval - run at intervals
		single-run - mediashow is run once and then stone
		then stops.
		Reaching the repeat interval will not interrupt
		playing tracks so all tracks in a repeating show
		must have non-zero duration or end naturally.
		To have a blank screen at the end of a
		mediashow include a 1 second long blank
		message track.
Repeat	10	The time between the start of one mediashow
Interval		and the start of the next in seconds:
		<ul> <li>If the value is less than the length of the</li> </ul>
		show play will be continuous.
		A value of 0 will always give a
Trigger For		continuous repeat of the show
End		<ul><li>How the end of a show can be triggered</li><li>none - the end trigger is not operative</li></ul>
Liid		<ul> <li>time -end the show at a time of day</li> </ul>
		<ul> <li>duration - end the show after a period of</li> </ul>
		time.
End Times	5:00	If Trigger For End = time:
		<ul> <li>A list of times of day h:m:s in 24 hour</li> </ul>
		format separated by spaces. (See
		Section 6.2.1)
		If Trigger For End = duration
		a period of time in h:m:s format.
		,

Field	Examples	Values
		Tracks of a mediashow can optionally provide an entry point for a show or track. If the play operation is executed the show will be started. The mediashow will continue when the subshow terminates.  If Has Child = yes the hint is displayed
Has Child	yes	yes/no. If yes the child show facility is enabled. The child show/track is defined in the medialist with the Track Reference of pp-child-show.
Hint Text	Press Play to	A single line of text
Hint Font	Helvetica 30 bold	Use the Font Chooser to select a font, or type one in:  See: http://effbot.org/tkinterbook/tkinter-widget-styling.htm
Hint Colour	white	Use the Colour Chooser to select a colour which will return a six digit hex number, or type in a colour name.  See: <a href="http://effbot.org/tkinterbook/tkinter-widget-styling.htm">http://effbot.org/tkinterbook/tkinter-widget-styling.htm</a>
Hint x	500	Position of left of text
Hint y	900	Position of top of text
		Show text is overlayed on all tracks in the show other than message tracks
Show Text	Picture of Taj Mahal	If not blank the text to be displayed.
Show Text Font	Helvetica 30 bold	Use the Font Chooser to select a font, or type one in:  See: http://effbot.org/tkinterbook/tkinter-widget-
Show Text Colour	white	styling.htm  Use the Colour Chooser to select a colour which will return a six digit hex number, or type in a colour name.  See: http://effbot.org/tkinterbook/tkinter-widget-styling.htm
Show Text x Position	100	distance of the start of the text from the left of the screen (pixels)
Show Text y Position	100	distance of the top of the text from the top of the screen (pixels)
Controls		If this show is at the top level of the show/sub- show stack then bindings for Internal and Run- time Operations overriding those in controls.cfg See Section 10.2.4
		Tracks played in the show need some configuration if not supplied in the individual tracks

Field	Examples	Values
Background	+/media/image.jpg	If not blank The file name of an image which is
Image		used as the background for any tracks in the
		show.
Background		Use the Colour Chooser to select a colour which
Colour		will return a six digit hex number, or type in a
		colour name.
		See <a href="http://effbot.org/tkinterbook/tkinter-widget-">http://effbot.org/tkinterbook/tkinter-widget-</a>
		styling.htm
		The background colour is set to black when Pi
		Presents starts. The value in this field is used by
		a track in the show if the value in the track's field
		is blank.
		If the resulting Background Colour is blank the
Transition	out	background colour is not changed.
Transition	cut	cut. Type of transition between tracks.
Duration	10	Currently not used. seconds. How long a track having no natural end
Duration	10	is displayed. A value of 0 displays continuously.
Image	original 10 100	For any image track in the show a viewport in
Window	onginal to too	which to show the image. See section 5.4.4.1
Villaovi	fit	Which to onew the image. Goo decitor of the first
	fit 1010 40 40	
	fit ANTIALIAS	
Video Audio	hdmi	hdmi/local/ <blank>. Sound output channel for</blank>
		any video track played by omxplayer from the
		show. If blank then the channel is set
) /' 1 A !'		automatically by the presence of a hdmi monitor.
Video Audio	0	Volume of audio for the video track (-60 -> 0 dB).
Volume Video	original	For any video track in the above a viewport in
Window	original	For any video track in the show a viewport in which to show the video.
VVIIIdow	warp	which to show the video.
	waip	original - use OMXPlayer default
	warp 10 100 200	behaviour
	700	Donavioui
		warp - scale to the size of the screen
		without maintaining aspect ration
		j .
		<ul> <li>warp followed by two x,y, pairs (top left,</li> </ul>
		bottom right) - the viewport window. The
		video is scaled to this size without
		preserving the aspect ratio.
Video Player		Other options for omxplayer (care required to
Options	11	avoid have a nice day!)
Audio Player	local	hdmi/local. Sound output channel for any audio
Audio	otoroo	track played by MPlayer from the show.
Audio Player	stereo	left/right/stereo. Speaker for any audio track
Speaker Audio Player	0	played by MPlayer in the show.
Audio Player Volume	U	Volume of audio track (-60 -> 0dB) played by MPlayer in the show.
VOIGITIE		ivii iayei iii iiie siiuw.

Field	Examples	Values
Audio Player Options		Other options for MPlayer (care required to avoid rejection!)
Web Window	warp warp 10 100 200 700	<ul> <li>For any web track in the show a viewport in which to show the web page.</li> <li>warp - scale to the size of the screen without maintaining aspect ration</li> <li>warp followed by two x,y, pairs (top left, bottom right) - the viewport window. The web page is scaled to this size without preserving the aspect ratio.</li> </ul>

#### 5.2.2 Menu

A menu show uses the Title and Thumbnail fields of tracks and of shows to automatically generate a menu on the screen. The Up and Down internal operations can then be used to scroll the menu and the Play operation used to play the track or show.

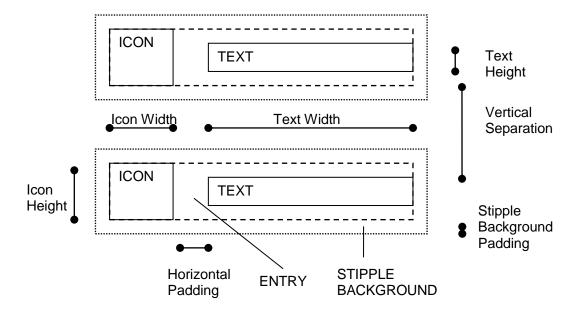

Using the fields in the Geometry Tab of the editor the presentation of the menu can be created:

- Display, thumbnails, bullets or Titles in many combinations
- Traverse the menu vertically or horizontally
- Create multi-column, multi-row menus
- Alter the separation, colours and font of the menu items

In addition to the menu entries two additional text fields, Hint text and Menu Text can be placed anywhere on the screen.

If a menu is not used for a period of time it might be useful to return to the parent show. The Timeout field, if non-zero, provides this function.

A menu can have a background image. The Has Background field enables this. The reference to the image file is in the medialist associated with the show.

Menu Geometry Definitions

Examples	Values
	Essential information
menu	Cannot be edited
	Text describing the show, displayed in the editor.
mymenu	A 'label' by which the show is referenced by other
	shows. Any text without spaces
	Not Used
themenu.json	Filename of the medialist file containing the tracks for the menu.
	The look and feel of the menu
Helvetica 30 bold	Use the Font Chooser to select a font, or type one in: see: <a href="http://effbot.org/tkinterbook/tkinter-widget-styling.htm">http://effbot.org/tkinterbook/tkinter-widget-styling.htm</a>
white	Use the Colour Chooser to select a colour which will return a six digit hex number, or type in a colour name.  see: <a href="http://effbot.org/tkinterbook/tkinter-widget-styling.htm">http://effbot.org/tkinterbook/tkinter-widget-styling.htm</a>
red	colour when the entry selected
60	seconds, If there is no activity on the menu Pi presents automatically returns to the previous display. 0 for no timeout.
	see mediashow - Background Colour for values
	menu mymenu themenu.json Helvetica 30 bold white

Has Background Image I yes wes/no. If yes an image is displayed behind the menu. The image is defined in the medialist with the Track Reference of pp-menu-background.  Menu Window I Menu Look and Geometry fullscreen, one or two pairs of x,y, coordinates fields are separated by spaces.  fullscreen - the menu is displayed full screen.  one x,y, coordinate - the second pair of coordinates specifies the bottom right corner of a bounding box for the menu.  Prince of the menu.  To wertical vertical, horizontal - the direction of laying out and traversing the menu.  If Direction = vertical the number of rows in the menu.  If Direction = vertical the number of columns in the menu.  It if Direction = horizontal the number of columns in the menu.  Icon Mode thumbnail - if the track has a thumbnail then this is displayed otherwise, if it is an image track the image is warped to the icon size otherwise a thumbnails is displayed which depends on the type of track.  bullet- the icon specified in Bullet is displayed.  none - the menu displays only text . 		Controls
Disable	no	yes/no
Controls		If 'yes' Internal Operations (play, pause, up, down,
		stop) and Run Time controls are disabled. This is
		a quick way to inhibit all controls for a concurrent
		show. For more selective control use the Controls
		field (See Section 6.4)

#### 5.2.3 Liveshow

A Liveshow is a sequence of one or more image, video, Web and audio tracks. The content is dynamically supplied.

Liveshows repeatedly display tracks in alphabetical sequence of filenames.

A show or track can be associated with a liveshow such that the show is accessible from any track in the show. These are termed child shows. The Has Child field tells Pi Presents that a child show is associated with the show; the show itself is referenced in the medialist for the liveshow. Associated with the use of a child show is Hint Text, this is displayed only when Has Child = yes.

A medialist associated with the liveshow is used to specify the child show and anonymous tracks in it will be ignored. A medialist must be associated with a Liveshow even if there is no child show.

Liveshows continue until they are stopped. Immediately after starting liveshows consider conditions for continuing:

 Liveshows with Trigger For Start = start will run immediately. Liveshows with Trigger For Start = time will proceed when the trigger condition is met. Liveshow triggering is explained in more detail in Section 6.2.1

Field	Examples	Values
		Essential information
Type	liveshow	Cannot be edited
Title	My Live Show	Text describing the show displayed in the editor
		and menu
Show	myliveshow	A 'label' by which the show is referenced by
Reference		other shows. Any text without spaces
Show		Not Used
Canvas		

Field	Examples	Values
Disable	no	yes/no
Controls		If 'yes' Internal Operations (play, pause, up,
		down, stop) and Run Time controls are disabled.
		This is a quick way to inhibit all controls for a
		concurrent show. For more selective control use
Trigger For	time	the Controls field (See Section 6.4)
Trigger For Start	ume	start/time/time-quiet How the liveshow proceeds after it is started:
Otart		start - continue without a wait
		time/time-quiet - wait for a time of day.
		time-quiet suppresses the next show
		message.
		Ŭ
Start Times	9:30 2:30	A list of times of day h:m:s in 24 hour format
<b>-</b> -		separated by spaces. (See section 6.2.1)
Trigger For	none	none/time
End		Trigger the end of the show  one - continue forever
End Times	12:00 17:30	<ul> <li>time - terminate at a time of day</li> <li>If Trigger For End = time:</li> </ul>
Liid Tiilles	12.00 17.30	A list of times of day h:m:s in 24 hour
		format separated by spaces. (See
		Section 6.2.1)
		,
		If Trigger For End is duration
	5	<ul> <li>a period of time in h:m:s format.</li> </ul>
Medialist	mymedia.json	Filename of the medialist file containing the child
Medialist	mymedia.json	show track for the liveshow. Must be present
		even if there is no child show.
		Liveshows can optionally provide an entry
		point for a show. If the play internal operation
		is executed the show will be started. The
		liveshow will continue when the menu terminates.
Has Child	yes	yes/no. If yes the child show facility is enabled. A
I las Offilia	, y 0 0	child show is defined in the medialist with the
		Track Reference of pp-child-show.
Live Tracks		Directory containing tracks for this show. (For
Directory		future expansion)
		A hint is a line of text displayed near the
		bottom of the screen when Has Child = yes. Used as a hint on the existence of a menu
		and how to enter it.
Hint Text	Press Play to	and not to onto its
Hint Font	Helvetica 30 bold	Use the Font Chooser to select a font, or type
		one in.

#### 5.2.4 Radiobuttonshow

A Radiobuttonshow provides the sort of show facilities that are in many kiosks namely:

'Start with an initial display which includes some text inviting the user to press buttons to initiate a track. Pressing one of the buttons plays a track that is attached to that button. While playing the track pressing another button starts the attached track. At the end of a track or when Stop is pressed revert to the initial display.'

In Pi Presents the initial display can be an image, message, video or audio track, or a show. Playing of other tracks is by means of play commands in the Links field of the Radiobuttonshow e.g.

but1 play myimagetrack but2 play myvideotrack

Each command has three fields separated by spaces:

- symbolic name the symbolic name of the input event that will trigger playing of the show or track.
- command always play for a Radiobuttonshow. This is not the same as the play Internal Operation.
- track the Track Reference of the track to be played.

While in the Radiobuttonshow the Internal Operations are not used. However when playing a track or show started by the Radiobuttonshow the Internal Operations may be required.

Field	Examples	Values

#### 5.2.5 Hyperlinkshow

A Hyperlinkshow provides the type of show facilities that are used in touchscreen displays in museums:

'Start with an initial page with some introductory text, video or image and a selection of buttons which allow the user to move to another page. Each page can have a different selection of buttons to link to other pages. When in any page other than the initial page additional buttons allow the user to go back to the previous page or to return to the initial page.

All of the touchscreen displays that I have tried in the last few months seem to work this way, or are Radiobuttonshows.

Every page in a Hyperlinkshow is a track. Each has a Links field which contains commands implementing the movement between tracks and back.

e.g.track 'story1b' might contain:

next-name call story1c alternative-name call alternative1 back-name return home-name home

xxx-name is the symbolic name of an input event. This example says either go forward to 'story1c' or to 'alternative1', return to the previous track (which was probably 'story1b'), or return to the home track which probably means going back through 'story1b' and 'story1a' without displaying them.

When executing the call command Pi Presents remembers where it has come from in the 'path' (essentially a stack) so the return command can go back one removing the current track from the path. Think of nested call and return of subroutines in a programming language.

There is a special track called the Home Track. The home command can go back along the path until it arrives at the Home Track so it is not necessary to know how far you have gone to get back to a known starting point.

Each link has three fields separated by spaces:

 symbolic name - the symbolic name of the input event that will trigger the command

- command call, return, goto, jump, exit, null, repeat
- track the Track Reference of the track to be played

Command	Argument	Effect
call	Track Reference	play Track Reference and add it to the path
return	<blank></blank>	return 1 back up the path removing the track from the path, stops at Home Track.
return	number	return n tracks back up the path removing the track from the path, stops at Home Track.
return	<track Reference&gt;</track 	return to Track Reference removing tracks from the path, goes through Home Track if necessary.
home		Return up the path to Home Track removing tracks from the path
jump	<track Reference&gt;</track 	play Track Reference forgetting the path back to Home Track
goto	<track Reference&gt;</track 	play Track Reference, forget the path
repeat	<blank></blank>	Repeat the current track without resetting the timeout.
null		inhibits the Link with the same symbolic name that has been defined in the show.
exit		end the Hyperlinkshow

Links can be placed in the Links field of the Hyperlinkshow in addition to the Links field of tracks. This is a convenience to save typing because the commands from the show are used in every track and the commands from the track are merged with them. Sometimes this is not desirable and using the null command in the track will cancel the command with the same symbolic name in the show.

The goto command does not remember where it has come from. It is used in special circumstances such as timeout. It is also an alternative way to call/return for implementing a back button. If used every back has to be a goto. It is not a good idea to mix call/return and goto in the same part of a Hyperlinkshow.

If a track, such as a video or a timed image, ends naturally there needs to be a way for Pi Presents to execute a Link command in order to determine what to do next. This is achieved by Pi Presents generating an internal input event with the symbolic name pp-onend; the Links field can then have a command to service it e.g.

pp-onend goto mynextpage or pp-onend repeat

There is a second special track the First Track. Pi Presents always starts the show here. In many applications Home Track and First Track will have the same Track Reference. They may however be different. This was designed such that First Track would start the show with an image or video to entice the user to click a link to move

to the Home Track in order to start the interactive sequence of tracks. Once past the Home Track pressing home return or jump would not return him to First Track. However the timeout would.

To ensure that the screen goes back to the First Track if the user leaves the screen there is a timeout. If activated the Hyperlinkshow goto's the Timeout Track. This could have the same Track Reference as the First Track but a separate Timeout Track allows for reset of, say, animation before goto First Track.

Tracks in Hyperlinkshows can be shows. However these cannot have links of their own but do inherit from the Hyperlinkshow, so may not be very useful.

While in the Hyperlinkshow the Internal Operations are not used, however when playing a track or show started by the Hyperlinkshow the Internal Operations may be required and are available.

When developing a hyperlinkshow application it is sometimes useful to see the path of pages that Pi Presents has remembered. To enable this edit pp\_hyperlinkshow.py to remove the # sign from self.debug = True at around line 88.

#### **5.2.5.1 Click Areas**

In the pilot application of the Hyperlinkshow that I am developing with a museum we envisage using either 'soft buttons' or a touchscreen to control the Hyperlinkshow, both of these require click areas.

In its screen.cfg file Pi Presents allows the definition of click areas. These are polygonal areas of the screen which are touch or mouse click sensitive. A touch or click will produce an input event identified by a symbolic name.

Click areas can have text, coloured backgrounds, and outlines. The click areas to be displayed on each page is determined by the symbolic names in the list of Links from the merged show and track Links.

A Hyperlinkshow can also be controlled from the keyboard or from buttons. In our pilot we intend to use 'soft buttons' a technique I last used on a computer system for the Navy where mice where not liked because they ran away in rough weather. We intend to have a row of buttons either at the side or bottom of the panel holding the screen, the legends for the buttons are click areas which will appear on the display in the appropriate position; they will have symbolic names which will not be used.

Field	Examples	Values
		Facutial information
		Essential information
Туре	radiobuttonshow	Cannot be edited
Title	My Live Show	Text describing the show displayed in the
		editor and menu.
Show	myliveshow	A 'label' by which the show is referenced by
Reference		other shows. Any text without spaces
Show		Not Used
Canvas		

Field	Examples	Values
Medialist	mymedia.json	Filename of the medialist file containing the
		tracks for the Hyperlinkshow. All tracks should
		have a Track Reference
Links	name call mytrack	See above
First Track	myfirsttrack	The Track Reference of the track that will form the initial display for the show.
Home Track	myhometrack	The Track Reference of the track that will form
		the root of the call/return path.
Timeout		The track displayed when a timeout occurs. Pi
Track		Presents does not return directly to the Home
		track as there may be a need to reset
		animation or stop concurrent shows.
		Usually this track will do whatever is required
		and 'goto' the Home Track after a short time. If
		the track is an audio track it can have no sound
		and a zero duration.
Disable	no	yes/no
Controls		If 'yes' Internal Operations (play, pause, up,
		down, stop) and Run Time controls are
		disabled. This is a quick way to inhibit all controls for a concurrent show. For more
		selective control use the Controls field (See
		Section 6.4)
Timeout	30	seconds. When playing a track if no user input
		is received or the track does not naturally finish
		before the timeout then goto the Timeout
		Track. A value of 0 disables the timeout
		function.
		Show text is overlaid on all images in the
		show.
Show Text	Picture of Taj Mahal	If not blank the text displayed in all image,
Show Text	Helvetica 30 bold	video and audio tracks in the show Use the Font Chooser to select a font, or type
Font	Ticivetica 30 bold	one in.
		See: http://effbot.org/tkinterbook/tkinter-widget-
Show Text	white	Styling.htm Use the Colour Chooser to select a colour
Colour	Wille	which will return a six digit hex number, or type
Colodi		in a colour name.
		See: http://effbot.org/tkinterbook/tkinter-widget-
Ob and Tarret	100	styling.htm
Show Text x Position	100	distance of the start of the text from the left of
Show Text y	100	the screen (pixels) distance of the top of the text from the top of
Position	100	the screen (pixels)
Controls		see mediashow for values
		Tracks played in the show need some
		configuration.

#### 5.2.6 Start Show

The Start show specifies the shows to be run in the Start Shows field. All shows specified in this field will be run when Pi Presents starts. Each show will run concurrently with other shows. Input events will be passed to all concurrent shows.

There are limits to combinations of resources that can be used with concurrent shows. These are described in Section 6.4.4

The Start Show must be present and serves just to initiate the first user defined shows.

Field	Examples	Values
type	start	Must always be start, not editable.
title	First Show	Text describing the show, displayed in the editor.
Show	start	must be 'start'
Reference		
Start	show1 show2	A list of Show References separated by spaces.
Shows		

#### 5.3 Medialists

Medialists are similar to playlists in a media player in that they define the tracks to be played. How they are played is defined by the show that they are associated with. Each entry in a medialist is a 'track'. Tracks can be of various types:

- image a still image
- video a track played by OMXPlayer.
- audio an audio track played by MPlayer
- message displays lines of text against a coloured background with optional background image.
- show shows can be used as tracks allowing nesting to any depth.
- child-show to specify the child show of a mediashow or liveshow.
- menu-background to specify the image file to be used as the background for a menu.

A medialist is generally associated with a single show. In Pi Presents they have been kept separate from the remainder of the show specification so that the same medialist can be used in two different shows.

#### 5.4 Tracks

Each type of track has fields describing how to display the track, some of these override the corresponding fields in the parent show.

- image a still image. Image types are currently those that can be rendered by the Python Imaging Library. Image size is best limited to the 1 megapixel region.
- video a track played by OMXPlayer. Playable video formats depend on the codec licences purchased from the Foundation.
- audio an audio track played by MPlayer. Any track type playable by MPlayer should be playable. The audio track type is very flexible as it has extended duration handling features.
- message displays lines of text against a coloured background with optional background image. Can also used to display a blank screen. It provides a simple slide preparation facility. If you want something better use Powerpoint or similar and export as .jpg displaying as an image.
- show shows can be used as tracks allowing nesting to any depth.
- child-show a track used to specify the child show of a mediashow or liveshow.
- menu-background a special track used to specify the image file to be used as the background for a menu.

#### 5.4.1 Track File Names

Track file names can be relative or absolute. Relative file names allow profiles to be portable. See Section 4.2.1

- The leading + sign in file paths allows tracks to be specified relative to the /pp\_home directory. If a plus sign is not present then the path must be absolute. It is recommended that media files be stored under /pp\_home if the profiles are to be portable.
- Absolute references do have their uses, for example in specifying internet url's e.g. http://www.mysite.com/ track to play.mp4

#### 5.4.2 Anonymous and Labelled tracks

Some medialist entries will have labels defined by the key Track Reference. If the Track Reference is blank then the track is included in a Menu or Mediashow. If the label is not blank then the track is used in Radiobuttonshows, Hyperlinkshows or for a special purpose. Currently there are two special purposes:

- The background image for a menu which has the label pp-menu-background
- The child show of a mediashow or liveshow which has the label pp-child-show

The field definitions for each type of medialist track follow in the next section.

#### 5.4.3 Show Track

The tracks in a show can themselves be shows. These are called sub-shows. Show tracks allow sub-shows to be included in a medialist. The Show To Run field specifies the Show Reference of the show.

#### 5.4.4 Image Track

Image tracks are rendered by the Python Imaging Library. (See hardware requirements for recommended image size). Image tracks can be paused with the Pause Internal Operation. Images can appear in a window, can have an image or colour as a background, can be overlaid with text; Track Text is overlaid on a per track basis, Show Text per show.

Field	Example	Values
Type	image	
Title		Displayed on a menu and in the editor
Track Reference		A label for the track - blank if the track is to be included in a menu or mediashow. Non-blank if the track is to be triggered from a symbolic name or is special.
Location	+/media/sarenam e.gif	The filename of the track which may be blank.
Duration	5	Seconds. If 0 then image is displayed until terminated by user input. If blank then the value in the parent show is used.

Field	Example	Values
Transition	cut	cut.
Image Window	original 10 100	A viewport in which to show the image. If blank then the value in the parent show is used otherwise see section 5.4.4.1
	fit 1010 40 40	
	fit ANTIALIAS	
Background Image	+/media/image.jpg	The file name of an image which is used as the background for the main image. If blank then the value in the parent show is used.
Display Show Background Image	yes	yes,no yes - the background image of the parent show is displayed if the track Background Image is blank no - the background image of the parent show is
		not displayed
Background Colour		Use the Colour Chooser to select a colour which will return a six digit hex number, or type in a colour name.
		See <a href="http://effbot.org/tkinterbook/tkinter-widget-styling.htm">http://effbot.org/tkinterbook/tkinter-widget-styling.htm</a> If blank then the value in the parent show is used.
Track Text	Picture of Taj Mahal	If not blank the text displayed on the image.
Track Text Font	Helvetica 30 bold	Use the Font Chooser to select a font, or type one in.
		See: http://effbot.org/tkinterbook/tkinter-widget-styling.htm
Track Text Colour	white	Use the Colour Chooser to select a colour which will return a six digit hex number, or type in a colour name.
		See: http://effbot.org/tkinterbook/tkinter-widget-styling.htm
Track Text x Position	100	distance of the left end of the text from the left of the screen (pixels)
Track Text y Position	100	distance of the top of the text from the top of the screen (pixels)
Display Show Text	yes	yes,no Allow or inhibit the display of show text for this track
Links	myname play track34	Link commands for Radiobuttonshow and Hyperlinkshow
Show Control at Beginning	start audio1	See Section 6.4
Show Control at End	stop audio1	See Section 6.4
Animation at Beginning	out1 on 1 out1 off 2	See Section 8

Field	Example	Values
	out2 on 1	
	out3 on 6	
Clear	no	yes/no See Section 8
Animation		
Animation at	out2 off	See Section 8
End		

#### 5.4.4.1 Image Window

The Image Window controls how an image is presented spatially. It contains a number of fields separated by spaces. If Image Window is blank then the value from the show is used.

The first field is one of original, shrink, fit or warp

#### original

The image is displayed at its original size. The command has optionally two arguments the x,y, coordinates of the top-left corner of the displayed image. If the arguments are omitted then the image is displayed centred on the screen.

e.g. original, original 100 100

#### • fit

The image is displayed such that it fits in the specified window maintaining its aspect ratio. The image is shrunk or expanded as required. The command has optionally four arguments the x,y, coordinates of the top left corner and bottom right corners of the displayed image. If the arguments are omitted then the image is displayed centred on the screen.

e.g. fit, fit 100 100 1000 500, fit 100 100 1000 500 BICUBIC

#### shrink

As fit except that the image is not expanded if it is smaller than the window.

e.g. shrink, shrink 100 100 1000 500, shrink 100 100 1000 500 BICUBIC

#### warp

The image is displayed such that it fits in the specified window without maintaining its aspect ratio. The image is shrunk or expanded as required. The command has optionally four arguments the x,y, coordinates of the top left corner and bottom right corners of the displayed image. If the arguments are omitted then the image is warped to be displayed full screen.

e.g. warp, warp 100 100 1000 500, warp 100 100 1000 500 BICUBIC

For fit, shrink and warp an optional filter, one of NEAREST, BILINEAR, BICUBIC, ANTIALIAS can be specified as the fifth argument, see

http://effbot.org/imagingbook/image.htm

thumbnail and resize sections. If the argument is omitted NEAREST is used.

#### 5.4.5 Video Track

A track played by OMXPlayer. Pi Presents should play any track that OMXPlayer can play (but see hardware requirements Section 12). Video tracks can be paused with the Pause Internal Operation. Videos can appear in a window, can have an image or colour as a background which can be overlaid with text; Track Text is overlaid on a per track basis, Show Text per show. The video itself cannot be overlaid with text because of OMXPlayer limitations.

Field	Example	Values
Туре	video	
Title	The Film	Displayed on a menu and in the editor
Track Reference		A label for the track - blank if the track is included in a menu or mediashow. Non-blank if the track is to be triggered from a symbolic name or is special.
Location	+/myvideos/film. mp4	The optional filename of the track.
Video Player Audio	local	hdmi/local. If blank then the value in the parent show is used.
Video Player Volume	0	Volume of video track (-60 -> 0 dB). If blank then the value in the parent show is used.
Video Window	original warp warp 10 10 500 1000	A viewport in which to show the video. If blank then the values are taken from the parent show.  • original - use OMXPlayer default behaviour  • warp - scale to the size of the screen
		without maintaining aspect ratio  warp followed by two x,y, pairs (top left, bottom right) - the viewport window. The video is scaled to this size without preserving the aspect ratio.
Background Colour	red	Use the Colour Chooser to select a colour which will return a six digit hex number, or type in a colour name.  See: <a href="http://effbot.org/tkinterbook/tkinter-widget-styling.htm">http://effbot.org/tkinterbook/tkinter-widget-styling.htm</a> .  If blank then the value in the parent show is
Background Image	+/images/back.jp g	The filename of an optional image that is displayed in the background, can be blank. The video, Show Text and Track text is displayed above the image. If blank then the value in the

		parent show is used.
Display Show	yes	yes,no yes - the background image of the parent show
Background		is displayed if the track Background Image is
Image		blank
		no - the background image of the parent show is
	5	not displayed
Track Text	Picture of Taj Mahal	If not blank the text to be displayed.
Track Text	Helvetica 30 bold	Use the Font Chooser to select a font, or type
Font		one in.
		See: http://effbot.org/tkinterbook/tkinter-widget-
		styling.htm
Track Text	white	Use the Colour Chooser to select a colour which
Colour		will return a six digit hex number, or type in a
		colour name.
		See: http://effbot.org/tkinterbook/tkinter-widget-
		styling.htm
Track Text x	100	distance of the left end of the text from the left of
Position		the screen (pixels)
Track Text y	100	distance of the top of the text from the top of the
Position	V00	screen (pixels)
Display Show Text	yes	yes,no Allow or inhibit the display of show text for this
Onow Text		track
Links	myname play	Link commands for Radiobuttonshow and
	track34	Hyperlinkshow
Show Control	start audio1	See Section 6.4
at Beginning	otop oudio1	See Section 6.4
Show Control at End	stop audio1	See Section 6.4
Animation at	out1 on 1	See Section 8
Beginning	out1 off 2	
	out2 on 1	
	out3 on 6	
Clear	no	yes/no See Section 8
Animation	+O#	Con Continu
Animation at End	out2 off	See Section 8
EIIU		

#### 5.4.6 Audio Track

A track played by MPlayer. Pi Presents should play any audio track that MPlayer can play. Sound can be directed to HDMI or analogue and to either of the analogue speakers. Audio tracks can be paused with the Pause Internal Operation

Audio tracks can have an associated display. The display can have a coloured or image background; Track Text is overlaid on a per track basis, Show Text per show.

The audio track has enhanced duration and screen control making it suitable for a 'dummy' track for controlling animation or concurrent shows with zero duration and without playing any media.

Field	Example	Values
Type	audio	
Title	The Music	Displayed on a menu and in the editor
Track Reference		A label for the track - blank if the track is included in a menu or mediashow. Non-blank if the track is to be triggered from a symbolic name or is special.
Location	+/tracks/music.mp3	The filename of the track. The location is optional. If blank the timing of the track is taken from the Duration field which must not be blank.
Duration	5	Seconds. If duration is blank then the track ends when the audio file ends or is aborted, or must be terminated by the user if there is no audio track.
		If zero then the duration is always zero. The Location field should be left blank so no audio track is played. Zero duration is aimed at use of the track for show or animation control.
		If greater than zero the 'track' ends at the stated time. If a file has been specified in Location the playing of the track may be cut short or there may be period of silence after the audio file.
Audio Player Speaker	left	left/right/stereo. If blank then the value in the parent show is used.
Audio Player Audio	local	hdmi/local. If blank then the value in the parent show is used.
Audio Player Volume	0	Volume of audio track (-60 -> 0 dB). If blank then the value in the parent show is used.
Clear Screen	no	yes/no The screen is normally not cleared at the start of an audio track as this would clear any concurrent displays from other shows. If you are using the audio track as part of a main show you may want to clear the screen of previous content.
Background Colour	red	Use the Colour Chooser to select a colour which will return a six digit hex number, or type in a colour name.
		See: <a href="http://effbot.org/tkinterbook/tkinter-widget-styling.htm">http://effbot.org/tkinterbook/tkinter-widget-styling.htm</a> . ).

		If blank then the value in the parent show is used.
Background Image	+/images/back.jpg	The filename of an optional image that is displayed in the background. The video, Show Text and Track text is displayed above the image. If blank then the value in the parent show is used.
Display Show Background Image	yes	yes,no yes - the background image of the parent show is displayed if the track Background Image is blank no - the background image of the parent show is not displayed
Track Text	Picture of Taj Mahal	If not blank the text to be displayed.
Track Text Font	Helvetica 30 bold	Use the Font Chooser to select a font, or type one in.  See: http://effbot.org/tkinterbook/tkinter-
		widget-styling.htm
Track Text Colour	white	Use the Colour Chooser to select a colour which will return a six digit hex number, or type in a colour name.
		See: http://effbot.org/tkinterbook/tkinterwidget-styling.htm
Track Text x Position	100	distance of the left end of the text from the left of the screen (pixels)
Track Text y Position	100	distance of the top of the text from the top of the screen (pixels)
Display Show Text	yes	yes,no Allow or inhibit the display of show text for this track
Links	myname play track34	Hyperlinks for Radiobuttonshow and Hyperlinkshow
Show Control at Beginning	start audio1	See Section 6.4
Show Control at End	stop audio1	See Section 6.4
Animation at Beginning	out1 on 1 out1 off 2 out2 on 1 out3 on 6	See Section 8
Clear Animation	no	yes/no See Section 8
Animation at End	out2 off	See Section 8

### 5.4.7 Web Tracks

Web tracks are rendered by the Webkit based uzbl browser.

You will have installed the uzbl browser when installing Pi Presents. You can use it in from the desktop like an ordinary program.

Web pages can be played from the internet or from the local file system. They can appear in a window or be fullscreen, can have an image or colour as a background and Track and Show Text. Track Text is overlaid on a per track basis, Show Text per show.

The integration of uzbl into Pi Presents is not as good as the other players; it is best used in non-interactive displays:

- The browser is loaded each time a web track is played; this can take up to 15 seconds. If you want to display a succession of web pages the Web Player in Pi Presents has a Browser Command script which allows a sequence of web pages to be displayed, with optional looping.
- Unlike other players, when the browser is in use 'focus' is on the browser window and not on Pi Presents. This means that keyboard inputs are sent to uzbl and not to Pi Presents until the Pi Presents window is clicked on. GPIO inputs are not affected.
- The browser window has scrollbars and title bar. Use of the browser affects the display of the task bar. Section 5.4.7.2 describes how to correct these.

Field	Example	Values
Туре	web	
Title		Displayed on a menu and in the editor
Track Reference		A label for the track - blank if the track is to be included in a menu or mediashow. Non-blank if the track is to be triggered from a symbolic name or is special.
Location	www.google.co.uk +/media/mywebpa ge.html	The filename of the track:
Duration	5	Seconds. If 0 then the web page is displayed until terminated by user input. If blank then the value in the parent show is used.
Web Window	warp warp 10 100 200 700	<ul> <li>A viewport in which to show the web page. If blank then the value in the parent show is used otherwise:</li> <li>warp - scale to the size of the screen without maintaining aspect ration</li> <li>warp followed by two x,y, pairs (top left, bottom right) - the viewport window. The web page is scaled to this size without preserving the aspect ratio.</li> </ul>

Helivetica 30 bold Font   Helivetica 30 bold Font   Helivetica 30 bold Font	Field	Example	Values
Value in the parent show is used.	Background		The file name of an image which is used as the
Display Show Show Show yes - the background image of the parent show is displayed if the track Background Image is blank no - the background image of the parent show is not displayed image.  Background Colour Use the Colour Chooser to select a colour which will return a six digit hex number, or type in a colour name. #### 5.4.7.1 Browser Commands

The Browser commands field contains 0 or more browser commands. Each command is on a new line. Some commands have an argument which is separated from the command by a space

Command	Description	uzbl Command used
load <arg></arg>	Load the web page specified by <arg>. <arg> may be:</arg></arg>	uri
	<ul> <li>an internet url</li> </ul>	
	<ul> <li>a full pathname to a file</li> </ul>	
	<ul> <li>a relative path to a file located under pp_home preceded by +</li> </ul>	
refresh	refresh the currently loaded web page	reload_ign_cache
wait <arg></arg>	wait <arg> seconds</arg>	-
exit	Normally the script loops after the last command is executed. Exit, as the last command, will end playing of the track.	-
loop	A single loop command is allowed. If a loop command is present execution will resume here after the last command of the script.	
uzbl <arg></arg>	Execute a uzbl browser command. The commands are defined here:	
	http://www.uzbl.org/readme.php	
	<arg> is the uzbl command together with its arguments.</arg>	
	These commands will allow tailoring of the display of individual web pages	

Example: repeating two web pages. Looping will continue until the track duration is exceeded.

wait 20

load www.google.co.uk

wait 20

load www.museumoftechnology.org.uk

Example: display two pages then exit to the next track.

wait 20

load www.google.co.uk

wait 20

load www.museumoftechnology.org.uk

wait 20 exit

Example: Refresh the initially loaded web page at 20 second intervals

wait 20 refresh

#### 5.4.7.2 Full screen Integrated Browser Displays

Out of the box uzbl will show a title bar. To remove this, edit the file /home/pi/.config/openbox/lxde-rc.xml to include the following just before the statement </applications>

```
<application name="uzbl*">
<decor>no</decor>
</application>
```

A reboot of the Pi is necessary for the edit to take effect.

When the browser is displayed the underlying Pi Presents window changes to reveal the task bar. To correct this, adjust the Taskbar and minimize it:

- Right click on the Taskbar and select Panel Setting
- Select the Appearance Tab. Select Solid colour and, choose black with 100% opacity.
- Select the Advanced Tab
- Set 'minimise panel when not in use' to On
- Set 'Size when minimized' to 2 pixels

Scrollbars are displayed when the content of a web page is larger than the window. These can be removed as described here. (not tested)

### http://www.uzbl.org/wiki/hide-scrollbars

Alternatively use the uzbl zoom\_out command in a Browser Command script to adjust the size of the page so scrollbars are not required.

#### 5.4.8 Message Tracks

Message tracks display text against a coloured background or optional image. They do not need a media file to be specified as the text is contained in the Message Text field.

Field	Example	Values
Туре	message	
Title	A Message	Displayed on a menu and in the editor
Track Reference		A label for the track - blank if the track is included in a menu or mediashow. Non-blank if the track is to be triggered from a symbolic name or is special.
Message Text	Welcome	The text to be displayed.
Duration	5	Seconds. If 0 then message is displayed until terminated by user input. If blank then the value in the parent show is used.
Text Font	Helvetica 30 bold	Use the Font Chooser to select a font, or type

		one in:
		See: http://effbot.org/tkinterbook/tkinter-widget-
		styling.htm
Text Colour	white	Use the Colour Chooser to select a colour
		which will return a six digit hex number, or type
		in a colour name.
		See: http://effbot.org/tkinterbook/tkinter-widget-
1 ('C' ('	1-6	styling.htm
Justification	left	left/center/right. Text justification.
Message x Position	100	If blank then the message is centred in the screen.
FUSILIOIT		If non-blank the distance of the left end of the
		text from the left of the screen (pixels)
Message y	500	If Message x Position is specified then
Position		distance of the top of the text from the top of
		the screen (pixels)
Background	red	Use the Colour Chooser to select a colour
Colour		which will return a six digit hex number, or type
		in a colour name.
		See: http://effbot.org/tkinterbook/tkinter-widget-
		styling.htm
		If blank then the value in the parent show is used.

Clear Animation	no	yes/no See Section 8	
Animation at End	out2 off	See Section 8	

## 5.4.9 Show Track

A show can be a track in another show. Uses might be:

- A mediashow made up of smaller mediashows
- A menu of mediashows, particularly presentations
- Menus with sub-menus
- A Liveshow run from a Mediashow which provides an initial screen.

Field	Example	Values
Type	show	
Title	My Other Show	Displayed on a menu and in the editor
Track Reference		A label for the track - blank if the track is included in a menu or mediashow. Non-blank if the track is to be triggered from a symbolic name or is special.
Show to Run	myothershow	Show Reference of the show to be run

### 5.4.10 Child Show Track

This is a labelled show entry which provides a referencing mechanism for the child show of a mediashow.

Field	Example	Values
Type	show	
Title	Child Show	Displayed on a menu and in the editor
Track Reference	pp-child-show	The label indicates the track contains a reference to a child show. The track will not be included in the menu or mediashow.
Show to Run	mychildshow	Reference to the show to be run

#### 5.4.11 Menu Background Track

Field	Example	Values	
Type	menu-background		
Title	Menu Background Displayed in the editor		
Track Reference	pp-menu-background	The label indicates this contains a reference to a menu background. The track will not be included in the menu or mediashow.	
Location	+/media/sarename.gif	The filename of the track.	

# **6 Controlling Shows**

### 6.1 Introduction

Show control in Pi Presents is very flexible to allow advanced applications to be built. Fortunately for most uses the out of the box configuration will suffice.

There are a number of control techniques for shows and their tracks, each having a specific use:

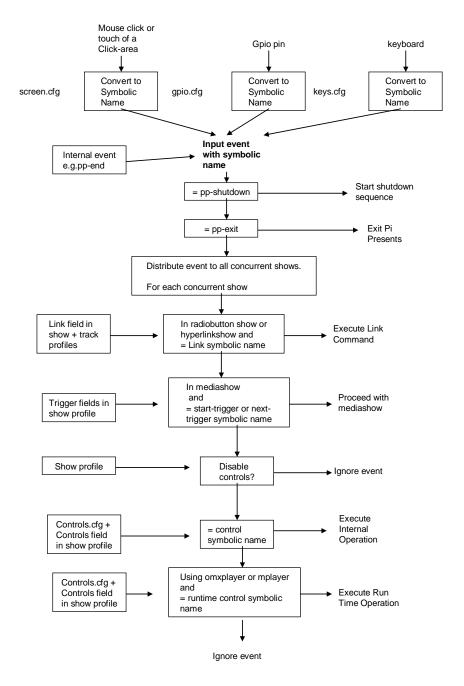

- Internal Operations play, pause, stop, up and down Internal Operations are used to control mediashows, menus and liveshows
- Triggers Triggers are used by mediashows as an alternative to Internal Operations. They are primarily used with GPIO inputs.
- Links Links are used by Radiobuttonshows and Hyperlinkshows to move between tracks.
- Run-time Controls OMXPlayer and MPlayer allow control of some aspects of their operation while a track is running.

Every control in Pi Presents; Internal Operation, Trigger, Link or Run-time control; is associated with a symbolic name. For example, out of the box, the up Internal Operation has been bound to the symbolic name pp-up in the file controls.cfg. Also you might set up a command in a Radiobuttonshow to play a track by inserting

myname play mytrack

in the Links field of a track. myname and pp-up are symbolic names.

Real world events such as a GPIO edge detection, a key press, or a mouse click are converted by Pi Presents into an 'input event' which is identified by a symbolic name. Thes symbolic name in the input event is compared with the symbolic names of the controls to determine the action to take. This comparison uses the procedure in the Figure below.

**Processing Input Events** 

Remember that a show can have sub-shows and tracks; input events are generally passed down so they affect the currently lowest level component.

When editing configuration (.cfg) files you will need to supply symbolic names. It is advisable not to create names beginning with pp- to avoid clashes with names used by Pi Presents.

# 6.2 Controlling Menus, Mediashows and Liveshows

Control of menus, mediashows and liveshows uses a set of 'Internal Operations'. Out of the box these operations are bound to a set of symbolic names and these in turn are bound to an arbitrary set of keyboard keys and GPIO inputs:

Internal Operation	'Out of the box' For GPIO Pin see Section 9.4			Effect
	Symbolic Name	Key	GPIO Pin.	
up	pp-up	Cursor Up		Previous track in mediashow or up for menu
down	pp-down	Cursor Down		Next track in show or down for menu
play	pp-play	Return		Start an entry in a menu, or start a child show.
pause	pp-pause	Spacebar		toggle pause for tracks that support pause.
stop	pp-stop	Escape		Stop playing a track or return to a parent show.

The 'out of the box' key for each operation is set in keys.cfg and the GPIO pin in gpio.cfg. The bindings can be modified as described in Section 10.2. Binding the Internal Operation to the symbolic name is in controls.cfg. It is unlikely you will want to modify these but you may wish to override them for an individual show as described below.

Remember that if more than one show is running concurrently the input event is passed to and potentially executed by each concurrent show. This may be undesirable, for example if a mediashow of audio tracks is running as a background to a manually advanced slideshow, we do not want the up and down operations to change audio track, so Disable Controls is used with the audio show.

If the Disable Controls = yes then the show must run automatically or be controlled by triggers as described in the next section.

For more advanced situations individual Operations can be inhibited or bound to alternative symbolic names for a specific show by reconfiguring the control using the Controls field of a show. This is described in Section 10.2.4.

#### 6.2.1 Triggering Mediashows and Liveshows

Mediashows have triggering facilities; liveshows have a subset of these and references to mediashow in the paragraphs below include liveshow where appropriate. The facilities are designed for use when the show is played without user interaction; however if Internal Operations are not disabled they can also be used to control the show (with care!)

In theory triggers can be applied to sub-shows and child shows, I have not tested these extensively.

#### 6.2.1.1 Trigger for Start

Immediately after a mediashow is run it uses the Trigger For Start field to decide what to do next, also after each track Trigger For Next can be employed to control movement to the next track:

Trigger For Start can take the following values:

#### start

The mediashow continues to the first track.

#### input/input-quiet

The mediashow waits for an input event before running the first track of the show. The symbolic name of the input event must be included in the Trigger Input field.

When an input event, such as a GPIO line changing state, is received Pi Presents generates and input event which is identified by a symbolic name. Symbolic names are assigned to GPIO pins in the gpio.cfg file (see Section 10.2.1). Out of the box P1-11 is configured as an input and assigned to the symbolic name PIR to provide continuity with the previous version of Pi Presents. So if PIR is specified in the Trigger Input field the show will start when P1-11 goes to zero.

There is an unexpected feature in Pi Presents; a waiting show is also triggered by the Play and Down operations. If you want to use just these choose input or input-quiet and leave the Trigger Input field blank.

#### time/time-quiet

To be able to use time of day either keep the Pi connected to the internet or invest in a hardware real time clock add-on.

The mediashow waits for a time of day before proceeding. A list of times of day must be included in the Trigger Input field.

Each time of day can specify hour, minute and optionally second as a 24 hour clock and should be separated by a space. Entries may be in any order. e.g.

21:2 21:03 9:30 9:30:30 0:0 23:59:59

Pi Presents will proceed with the show when the local time reaches one of the times specified in the list. If a show is being played when a time in the list is reached the show will not be interrupted or the need for a show to proceed remembered.

If there are no shows left in the list for today then the first show in the list will be scheduled and started tomorrow.

If the option is time and not time-quiet an admin message is displayed while waiting for the show to commence. It is possible to show the time of the next show in the admin messages, see Section 10.3. There is an alternative message for shows starting tomorrow.

Pi Presents may not cope with changes to daylight saving time or any other non-linear changes in local time.

There is an alternative way to specify the time of day. If +10 +40 is entered instead of, say, 09:30 then the show will start in 10 seconds time then in 40 seconds time from when the mediashow was started. This is aimed at testing only.

#### 6.2.1.2 Trigger for End

Some mediashows that repeat, or whose Sequence = shuffle, and all liveshows will not end naturally; they require their end to be forced.

This can be useful in some circumstances, for example:

- Running a liveshow throughout the day and then a 'we are closing'
  mediashow at a particular time of day. Run the two shows concurrently and
  terminate the liveshow with a time based Trigger For End and use a time
  based Trigger for Start to continue the 'we are closing' mediashow a little
  later.
- Terminating a repeating mediashow or a mediashow that has Sequence=shuffle. The latter cannot be naturally terminated even if it is a one-shot show because, where is the end of a random sequence? In this case the Duration option might be preferred over the time of day.

Trigger for End can take the following values:

- none
   The end trigger is not operative.
- time

To be able to use time of day either keep the Pi connected to the internet or invest in a hardware real time clock add-on.

The mediashow continues until the time of day for ending. A list of times of day must be included in the Trigger End Times field.

Each time of day can specify hour, minute and optionally second as a 24 hour clock and should be separated by a space. Entries may be in any order. e.g.

21:2 21:03 9:30 9:30:30 0:0 23:59:59

Pi Presents will terminate the show when the local time reaches the appropriate time specified in the list.

The system will allow shows to proceed over midnight so a show starting at 23:55 can be terminated at 00:05 the next day.

Pi Presents may not cope with changes to daylight saving time or any other non-linear changes in local time.

There is an alternative way to specify the time of day. If +20 + 50 is entered instead of, say, 09:30 then the show will end in 20 seconds time then in 50

seconds time from when the mediashow was started. This is aimed at testing only.

#### duration

The mediashow is terminated after a specified period of time. The time period should be entered in the Trigger End Time field as hour, minute, second.

The format is h:m:s hour and minute are optional. e.g.

5 - 5 seconds 6:0 - 6 minutes 10:0:0 - 10 hours

#### 6.2.1.3 Trigger for Next

The Trigger For Next field allows individual tracks in a mediashow to be triggered by an input event. For this to function correctly Progress should be set to manual:

- none
   The trigger is not operative.
- input
   The show moves to the next track when it is triggered by the input event having the symbolic name specified in Next Input.

## 6.3 Controlling RadiobuttonShows and Hyperlinkshows

These shows are controlled by commands in their Links field and in the Links field of their tracks. This is described in Section 5.2.5 and 5.2.4. For example the command in the Links field of a Radiobuttonshow

myname play mytrack

will play a track with the track reference mytrack when an input event with the symbolic name myname is received. Links are not disabled by Disable Controls

Radiobuttonshows and Hyperlinkshows do not use Internal Operations, however any tracks and shows run by them might.

## 6.4 Controlling Concurrent Shows

#### 6.4.1 Introduction

Pi Presents can run two or more shows concurrently. The concurrent shows appear to run in parallel and Input Events are passed to all concurrent shows. This is essential but if not managed carefully can lead to some undesirable effects. Most of the common situations can however be addressed by Disable Controls

Providing a background audio track to a slideshow.

Use two mediashows, one with a manually controlled slideshow and the other with the audio tracks. The latter will need the controls disabled using Disable Controls if there is any customer interaction with the former.

- Running shows at specific times of day
   Use two or more liveshows or mediashows each triggered at time of day such
   that they do not overlap. The liveshow and mediashow can also be stopped at
   a specific time of day or after a period of time.
- Being really thrifty and doing two completely different tasks with the same Pi, perhaps a slideshow in the Reception with child show facilities, and a dummy talking in a museum exhibit triggered by a PIR using a single shot mediashow. In this case disable controls for the exhibit and rely on the Trigger For Start field which is not affected by Disable Controls.

More complicated scenarios can be addressed by overriding the bindings of the Controls for a specific show. The default bindings of symbolic name to Internal Operation are in controls.cfg. Using the Controls field of a show an Internal Operation can be bound to a different symbolic name for the show and hence be triggered by a different input. Alternatively the override can disable individual operations for that show.

There is more discussion of this in Section 10.2.4

#### 6.4.2 Starting and Stopping Shows

Concurrent shows run in parallel. There are two methods to start and stop concurrent shows:

- Start one or more shows by including their show references in the Start Shows field of the Start Show. All shows specified in the Start Shows field of the Start Show will be run when Pi Presents starts.
- Use a Show Control command in Show Control field of a track to start or stop a show e.g.

myshow start myothershow stop

Shows started in the Start Show can be stopped by a Show Control command.

Only one instance of a show can be running at a time. Attempts to start a show that is already running will be ignored.

#### 6.4.3 Exiting Pi Presents and Shutdown of the Pi

In addition to starting and stopping shows Show Control commands can be used to exit Pi Presents or to shut down the Raspberry Pi e.g.

pipresents exit gobbledegook shutdownnow Any word can be used instead of the word pipresents

#### **6.4.4 Limitations on Concurrency**

Concurrent shows have some limitations due to limits built into Linux, MPlayer and OMXPlayer:

- Two shows cannot in general use the screen at the same time.
- If audio tracks to be played with MPlayer might overlap then they should all
  use the same output, either HDMI or Analogue. If not, switching will occur
  mid-track and I find the Pi crashes. If you want to play two audio tracks that
  might overlap you can use Videoplayer to play one of them or just direct each
  of the tracks to left and right outputs.
- HD videos may stutter while an audio track is being played.
- Animation outputs are delayed if they are coincident with the start of an audio track or image. The output event will not be missed but will be delayed.

## 7 Remote Operation

Pi Presents was not intended for remote operation however by popular demand I have included a facility where a 'Liveshow' can play tracks dynamically ftp'ed from another computer.

The New> Liveshow template is a working Liveshow. The tracks to be played should be placed in /home/pi/pp home/pp live tracks.

The types of track that a Liveshow recognises are in the first few lines of pp\_definitions.py.

Tracks can be ftp'ed into the Pi using Filezilla or some such. Using the -I command line option of Pi Presents it is possible to have a second location containing live tracks, one in the data home as above and another in another directory specified by the -I option. The directory could be on a remote fileserver (I have not tried this, Samba required?).

Alternatively the complete profile for a show could possibly be held on a remote fileserver.

You may need to set your Pi to use static IP and take network security measures if you use this, as a minimum change the password for user Pi.

#### 8 Animation Control

All types of track have facilities to control animation. Using commands included in the 'Animation at Beginning' and 'Animation at End' fields a GPIO output can be turned on or off synchronised with the start or end of tracks, with optional delay.

An example of animation commands is shown below.

animate at	out1 on 1
beginning	out1 off 2
	out2 on 1
	out3 on 6
Clear	no
Animation	
Animation at	out2 off
End	

A command has three fields separated by spaces and terminated with a newline:

- Symbolic Name The name of the output as defined in gpio.cfg (Section 10.2.1). There can be different gpio.cfg files for each profile.
- State to go to on or off
- Delay seconds as a positive integer or 0. If the field is omitted 0 is assumed.

The state of GPIO outputs before Pi Present starts is not well documented and seems to vary between pins and versions of the Pi so be careful if there is anything of concern attached to an output.

All outputs are set to the off state when Pi Presents starts. Commands in Animation at Beginning are executed at the beginning of a track and Animation at End at the end of a track. When the commands are executed the required changes to the GPIO are put in a queue for firing at the appropriate time. The time is not affected by pausing a track.

Animation commands in the queue are not forgotten at the end of a track so animation can be extended over a show. A side effect of this is that it is possible for a GPIO change to happen after a track or show has finished. If you want to avoid this and ensure outputs are in a defined state at the end of a track set Animate Clear to yes. If yes then, before Animation at End is executed, the queue will be cleared of those events that were commanded by the track but not fired.

## 9 Black Box Operation

There are a number of things to set up to make Pi Presents into a full screen, auto starting, GPIO controlled application. You do not need to use them all.

## 9.1 Command Line Options

python pipresents.py -h will show the command line options

Ontions	
Options	

-pprofile <arg></arg>	Name of the profile to be used. e.g. pp_mediashow
	3 11 = 3 3 3
	If this is not specified then it defaults to pp_profile.
-ggpio	Enable the Pi's GPIO system. To use this Pi Presents must be
	run as root:
	sudo python pipresents.py -g
	sade pronon preprocessory
-bnoblank	Disable screen blanking.
	For this to function v11 conver utile must have been installed
-ffullscreen	For this to function x11-server-utils must have been installed.  Run Pi Presents in full screen mode.
-iiuliscreen	Null 11 Tesents in full screen mode.
-ohome <arg></arg>	Location of the Pi Presents 'data home' directory
	e.g. /media/USBSTICK or /home/pi/my_data
	If this option is not specified it defaults to the users home
	directory.
	all colory.
	NOTE: If sudo is used then the user's home directory is /root so
	the option must be specified with a full path. Furthermore, to be
	safe it is best to specify the full path whenever executing
-ddebug	pipresent.py from anywhere other than the pipresents directory.  Run time errors give alerts and are reported to the terminal
-u-ucbug	window if open. Turning on debugging will provide an additional
	log of the operation of Pi Presents in the terminal window.
	Errors and the log are also recorded in the
	/pipresents/pp_log.log file.
-vvalidate	Validate the profile when Pi Presents is started.
-Iliveshow <arg></arg>	Liveshow tracks are always played from the directory
	pp_live_tracks in the data home specified in the -o option
	defaulting to
	/home/mi/on home/nn live twost-
	/home/pi/pp_home/pp_live_tracks
	If the -I option contains a directory path this is used as a second
	source for liveshow tracks.
	e.g. /home/pi/mylivetracks

# 9.2 Specify a Profile

The --profile (-p) command line option specifies the profile to use. This is the name of the profile directory in the pp\_profiles directory. If the option is omitted it will default to pp\_profile.

The prefix pp\_ means nothing special other than denoting files provided by the developer.

## 9.3 Specify a Home Directory

The --home (-o) command line option specifies the location of Pi Presents data home. If the option is omitted it will default to the users home directory. **NOTE**: If sudo is used then the user's home directory is /root so the option must be specified. Furthermore, to be safe it is best to specify the full path whenever executing pipresent.py from anywhere other than the pipresents directory.

USB sticks can be used to hold profiles and media. They will be assigned mount points in the /media directory.

#### e.g. /media/KINGSTON

Raspbian will auto mount USB sticks if they are present at power on, or plugged in afterwards. If Pi Presents is started at power on it takes up to 10 seconds for the drive to be mounted; Pi Presents allows for this.

Raspbian will compute the mount point from the name of the drive on the stick. If preparing the USB Stick on a Windows machines it appears Windows converts all entered drive names to upper case.

## 9.4 Using GPIO to Control Pi Presents

GPIO control is enabled using the --gpio command option. If GPIO is used then the command starting Pi Presents must be preceded by sudo.

Out of the box the following pins of the GPIO connector 1 are bound to the following symbolic names in gpio.cfg. The binding can be modified as described in Section 10.2.1

Bound Pin	Symbolic Name	Bound Key	Function		
Internal Ope	erations				
P1-15	pp-down	Cursor Down	Next in show or down for menu		
P1-16	pp-up	Cursor Up	Previous in show or up for menu		
P1-18	pp-play	Return	Start a mediashow or play the standard child show.		
P1-22	pp-pause	Spacebar	toggle pause for videos.		
P1-7	pp-stop	Escape	Stop playing a track or return to the higher level show.		
User Bindin	User Binding				
P1-11	PIR	-	Not an internal operation		
Special Bindings					
P1-12	pp-shutdown	-	Press for 5 seconds to exit Pi Presents and shut down the Pi.		
-	-	CTRL-BREAK	Abort Pi Presents. Focus		

	must be on a Pi Presents
	window.

Out of the box the GPIO ports are configured as edge triggered inputs with internal pull-up resistors and for the following device characteristics:

- Push buttons should be mechanical, push to make (normally open), and be connected between the GPIO pin and 0 volts.
- PIR's should have Normally Closed relay contacts and be connected between the GPIO pin and 0 volts.

Inputs can be changed from normally open to normally closed and vice versa by changing the edge which is used for triggering as described in Section 10.2.1

A 330 ohm resistor is series with the button or PIR is recommended to protect the Pi should the inputs inadvertently be used as outputs.

```
GPIO Pin ---- 330R ---- contact --- 0 volts
```

Be very careful not to connect a GPIO pin to the +5volt pin; it is likely to fry your Pi

There is software contact de-bouncing which is set with a small hysteresis. If you have problems with contact bounce increase the THRESHOLD of the appropriate pin by modifying gpio.cfg (See Section 10.2.1).

## 9.5 Disable Screen Blanking

To disable screen blanking you must first install xset which is part of the x server utilities package, this should have been done if you followed the install instructions..

```
sudo apt-get install x11-xserver-utils
```

You can then use the --noblank command option to disable screen blanking.

## 9.6 Start Pi Presents when Power is applied to the Pi

This will function only if you have set 'boot to desktop' using raspi-config.

Create the folder /home/pi/.config/lxsession/LXDE

Note: The directory .config is already present in the image but you will need to select 'Show Hidden Files' in the File Manager to see it.

• In this folder put a file named autostart containing one line specifying the full path of pipresents and of the home directory:

```
e.g. sudo python /home/pi/pipresents/pipresents.py -o
/home/pi -p myprofile
```

 Make the autostart file executable by using the properties menu in the File Manager to alter the permissions on the file.

## 9.7 Shutdown the Raspberry Pi from the GPIO

Press the Shutdown button for more than 5 seconds. Pi Presents will exit and safely shut down the Pi.

The PI can also be shut down by using a Show Control command as described in Section 6.4.3

## **10 Configuring Pi Presents**

## 10.1 Location of Configuration Files

The out of the box configuration of Pi Presents is defined in a set of files in /pipresents/pp\_home:

- gpio.cfg gpio inputs and animation outputs
- · keys.cfg keyboard
- screen.cfg click areas on the monitor
- controls.cfg internal operations and run-time operations
- · resources.cfg administrative messages

The .cfg files are all text files which can be edited by Leafpad. Do not edit the files inside /pipresents/pp\_home; if you wish to change their content then copy the file to either:

- Inside a profile e.g. inside /home/pi/pp\_home/pp\_profiles/myprofile
- The data home directory, e.g. /home/pi/pp\_home

Pi Presents looks for a .cfg file first in a profile, then in the data home directory, then in /pipresents/pp\_home.

If changing these files beware:

- The file in /pipresents/pp\_home may be overwritten by updates to Pi Presents.
- There is little checking of the content of these files by Pi Presents. If you
  modify the file run pipresents.py from a terminal window first so that any
  Python error messages can be displayed.

## 10.2 Configuring Inputs and Outputs

Section 6.1 describes the input system of Pi Presents and how external events are converted to input events. Most of the responses are configurable using the files described in this section.

When editing configuration files you will need to supply symbolic names. It is advisable not to create names beginning with pp- to avoid clashes with names used by Pi Presents.

#### **10.2.1 Configuring GPIO Pins**

BEWARE: Accidentally using a pin as an output with the output shorted to ground or +3.3 volts might fry your Pi, use a series resistor on every input and output for protection.

The configuration of the GPIO used by Pi Presents is defined in the file gpio.cfg. The file in /pipresents/pp\_home/gpio.cfg configures Pi Presents for the buttons and the PIR described in this manual and used by the examples.

gpio.cfg maps physical Pi GPIO input and output pins to the symbolic names of inputs and outputs used by Pi Presents. It also configures the input pins.

A section for every pin must be present in the file. A pin with direction=none is ignored .

#### Inputs

Each pin can generate an event having the specified symbolic name in any of four ways:

- rising edge An event with the symbolic name specified in 'rising-name' is generated when the input changes from 0 to 1 (0 volts to 3.3 volts)
- falling edge An event with the symbolic name specified in 'falling-name' is generated when the input changes from 1 to 0 (3.3 volts to 0 volts)
- one state An event with the symbolic name specified in 'one-name' is generated at 'repeat' intervals while the input state is '1' (3.3 volts). The first event happens after 'repeat' interval. If you want the input to respond immediately set the rising edge event to the same symbolic name.
- zero state An event with the symbolic name specified in 'zero-name' is generated at 'repeat' intervals while the input state is '0' (0 volts). The first event happens after 'repeat' interval. If you want the input to respond immediately set the falling edge event to the same symbolic name.

If you do not want the event to be generated leave the symbolic name blank

For the purposes of this manual and the examples gpio.cfg is set up to allow normally open push buttons connected to ground (0 volts) and a PIR with a normally closed contact connected to ground.

#### **Outputs**

The logical 'ON' state produces +3.3 volts. The logical 'OFF' state produces 0 volts

Pi Presents initialises GPIO outputs to 0 volts so it is best to design relays etc. for positive logic.

#### 10.2.2 Configuring Click Areas

The file screen.cfg defines the areas of the screen that will become mouse click or touch sensitive.

The file consists of a number of sections each with a unique name. The name can be anything but must be unique within the file.

All fields in each section must be present. The fields of each section are used as follows:

- name The symbolic name of the click area. Each command in the Links field
  of a track has a symbolic name. When the track in a hyperlink show is played
  the click-areas in the Links field are displayed on the screen and when an
  area is clicked the symbolic name will identify an input event.
- points this is a set of x y pairs that defines the points of a polygon bounding the area. The polygon is automatically closed so a quadrilateral will have 4 (not 5) x,y pairs. There must be at least three pairs of points. For details of this and other attributes see <a href="http://effbot.org/tkinterbook/canvas.htm">http://effbot.org/tkinterbook/canvas.htm</a> create\_polygon
- fill-colour, outline-colour

Specifies the look of the polygon. Use a blank field for transparent

text, text-font, text-colour

If text is not blank then the text is written centred in the polygon.

#### 10.2.3 Configuring Keyboard Keys

Keyboard keys are bound to symbolic names in the file keys.cfg. The file has a number of lines with the format

condition = symbolicname

The conditions are defined in <a href="effbot.org/tkinterbook/tkinter-events-and-bindings.htm">effbot.org/tkinterbook/tkinter-events-and-bindings.htm</a> in the <Return>, a, and <Shift-Up> sections. The conditions and the symbolic names are case sensitive.

In addition to these bindings the printing characters on the keyboard, (the ones obeying the <Key> condition in the reference), are automatically bound to the symbolic name pp-key-x

e.g the 'a' key produces pp-key-a

Automatic binding of a printing key can be overridden by a line such as a = pp-pause.

Note: <any control> = pp-shutdown will not work as pp-shutdown needs to be asserted for 5 seconds. It is useful for gpio only. However you can shutdown the Pi from Pi Presents using a show control command or by binding a key to the special symbolic name pp-shutdownnow.

#### 10.2.4 Configuring Internal and Run-Time Operations

#### **Internal Operations**

The file controls.cfg binds symbolic names to the Internal Operations of Pi Presents. This is different to the other configuration files which bind external event detections to symbolic names.

It is unlikely that you will want to modify this file, more likely you will want to use the Controls field in a Show to change the binding for a specific show. The symbolic name that is bound to an internal operation can be changed for a top level show and all its child/subshows by specifying a new symbolic name for the function in the Controls field of the top level show.

The operation can also be disabled for the show stack by binding the symbolic name to null. e.g.

In the Controls field of a show:

mypause pause pp-stop null

will make an input event matching mypause toggle the pause for tracks of this show instead of pp-pause and inhibit any action for pp-stop when received by this show, its sub-shows, or tracks.

#### **Run-Time Controls**

The file controls.cfg may be used to add run-time control operations. OMXPlayer and MPlayer have a number of run-time controls which are specified here

https://github.com/popcornmix/omxplayer

and here

http://www.mplayerhq.hu/DOCS/man/en/mplayer.1.html#INTERACTIVE%20CONTROL

The operations must be a single character from the list of operations and be preceded by omx- or mplay- respectively. Multi-character sequences are not currently supported.

For example:

videovolup = omx-+ videovoldown = omx-- adds volume control to omxplayer. videovolup can be bound to a key, gpio pin etc. Keyboard keys naturally have repeats; for GPIO pins gpio.cfg can enable repeating for buttons.

For the uzbl browser used to display web tracks the commands useable for run-time controls are defined here:

#### http://www.uzbl.org/readme.php

The command strings should be preceded by uzbl-

For example:

largerweb = uzbl-zoom\_in

will make the content of the browser larger.

Run-time operations may also be defined in the Controls field of a show.

## 10.3 Modifying Admin Messages

A few administrative messages seen by customers cannot be controlled using profiles.

resources.cfg is a text file which can be edited using Leafpad. It has a section for each show or player which has messages which are displayed to customers. e.g.

```
[mediashow]
# waiting for user to start a show with progress = manual
m01 = To start the show press 'Play'
```

```
# waiting for trigger from PIR m02 =
```

There is a comment (#.....) which describes how the message is used and a number, e.g. m01, which is used to refer to the message in the Python code.

You can edit the text after the = sign to change a message or, if blank, to not display the message.

Make sure to try out your edits by running Pi Presents from the terminal window so that any Python exceptions due to mistakes in edits are displayed.

Two of the messages allow the time of the next show to be displayed. This is achieved by inserting %tt in the message string.

## 11 Plugins

Plugins are python code modules with a documented interface specification that can be developed to enhance the displays and I/O of Pi Presents:

- Track Plugins allow dynamic display of information such as time, weather, and tickers. It is likely that information will be scraped from web sites or from RSS feeds.
- Input/Output Plugins will allow the development other interfaces to replace the Discrete GPIO, Keyboard, and mouse click interfaces. Possibilities are UART/RS232, I2C, DMX over IP or custom interfaces to connect together several Pi Presents. The I/O plugin does not exist yet but the introduction of input events and symbolic names in the previous issue is the key to this.

## 11.1 Track Plugins

Track plugins are executed by Players just before the track to be played is started. Their primary use is to display dynamic content. This can be achieved in two ways:

- By modifying or replacing the track to be played.
- By writing dynamic information direct to the Pi Presents display

Track plugins are stored in the directory /pipresents/pp\_home/pp\_plugins in .py files. It is recommended that the plugin file name is preceded by your initials so that there is no clashes with python modules (e.g. time.py will clash with the standard time module.)

#### **Using Plugins**

If the plugin is requied for a track then the 'Plugin Configuration File' field of a Player should contain the name of a Plugin Configuration File e.g. +/media/weather\_ny.cfg. Relative paths are allowed.

The Plugin Configuration File allows the same plugin to be called with different parameters. It must contain at least

```
[plugin]
plugin = pluginname
type = image  # required if the plugin is to be used in a liveshow
```

pluginname is the name of the python module containing the plugin (the filename without .py). Plugins are stored in /pipresent/pp\_home/pp\_plugins

The configuration file may define further parameters which will be available to the plugin via the dictionary plugin\_params:

```
e.g.

[plugin]

plugin = krt_weather

type = image  # required if the plugin is to be used in a liveshow

# optional

zip = USNY0996:1:US

place = New York
```

so by using a number of configuration files all calling the same weather plugin you can have a different weather report in each track.

You can use plugins in Liveshows. To do this the plugin must be specially written, all my examples are. To use a plugin in a liveshow just copy the plugin configuration file to pp\_live\_tracks.

The example pp\_plugin\_1p2 demonstrates all of this.

#### **Writing Plugins**

Out of the box there are two plugins of particular interest to new developers which demonstrate the primary features and document the details of the interface. Other plugins are minor variants of these for different types of track etc.:

krt\_weather.py modifies the track file specified in the track profile. It uses PIL
to add some information scraped from a weather website, saves the modified
image and returns its path so it can be displayed by Imageplayer. This
example contains lots of API documentation.

The Python Imaging Library (PIL) Handbook is at <a href="http://effbot.org/imagingbook/pil-index.htm">http://effbot.org/imagingbook/pil-index.htm</a>.

Tkinter canvas operations are documented at <a href="http://effbot.org/tkinterbook/canvas.htm">http://effbot.org/tkinterbook/canvas.htm</a>

The functional interface varies slightly depending on the type of the track:

- image the plugin will be supplied with the path to a file containing an image (e.g picture.jpg). An image track file can optionally be returned. If returned then it must be able to be displayed using PIL and Tkinter. The plugin can also write directly to the canvas.
- audio the plugin will be supplied with a file containing audio. An audio track can optionally be returned that is playable by mplayer. Blank is allowed and no audio will be played. The plugin can also write directly to the canvas.
- video the plugin will be supplied with a file containing a video. A video track
  can optionally be returned that is playable by omxplayer. Blank is allowed but
  will cause the videoplayer to exit immeadiately. The plugin can also write
  directly to the canvas but be aware that the video will appear over the top of
  the text so use video\_window to window it.
- web the plugin will be supplied with a file containing html code (whatever uzbl supports for rendering). A html file should be returned that is playable by uzbl. The plugin can also write directly to the canvas but be aware that the browser will appear over the top of the text so use Web Window to window it.
- message the plugin will be supplied with the text that would have been displayed, this can be modified and returned. The plugin can also write directly to the canvas.

## 11.2 Input/Output Plugins

TBD

## 12 Hardware Requirements

Pi Presents can be used with either Rev 1 or Rev 2 Pi's. The GPIO pins have been chosen such that they are version agnostic. 256MB Pi's can be used provided image size kept to the 1 megapixel region.

The RAM memory split is determined by OMXPlayer and on 256MB machines should be the minimum that OMXPlayer requires so as to allow the maximum RAM memory for the handling of images. OMXPlayer plays some videos using 64MB of RAM; others need 128MB, especially if you want sub-titles.

Display of images is slow. A one megapixel images takes a couple of seconds to display. The one 10 megapixel image I tried took 10 seconds to display and crashed a 256MB Pi. Larger images, greater than the screen pixel dimensions, will do nothing to improve the picture and will take longer to display even on 512MB machines; I use the brilliant Faststone Photo Resizer <a href="http://www.faststone.org/FSResizerDetail.htm">http://www.faststone.org/FSResizerDetail.htm</a> to reduce the size of images on a Windows PC.

Use the HDMI or 3.5mm jack output for audio. Amplification and volume control will need to be provided in external hardware to suit the application.

## 13 Updating Pi Presents

For safety take a copy of the pipresents folder and any data before doing updates.

Download Pi Presents from github and install it as described in the README.md file. Data stored in /home/pi/pp\_home will not be affected. Do not store your data in the pipresents/pp\_home directory as it may be overwritten.

As Pi Presents develops new fields will be added to the profile definition and others deleted. To control this, the three elements - Pi Presents, the editor and the profiles - must have the same version. Pi Presents will object if a profile with the wrong version is used. To correct this open the profile in the editor, it will automatically update the version of the profile and its fields. There will be a few residual update tasks that cannot be automated; read the release notes to identify these.

If you have many profiles to update in the same /pp\_home then you can use the 'tools>update all' menu option of the editor to update them.

The profiles in pipresents-examples will be kept compatible with the latest version of Pi Presents. Beware, re-installing these might overwrite profiles you have made.

When updating Pi Presents read the release notes. You may need to update the configuration files and carry out a few tasks that cannot be done automatically.

# 14 Bug Reports and Feature Requests

Please use the Github Issues Tab <a href="https://github.com/KenT2/pipresents/issues">https://github.com/KenT2/pipresents/issues</a> or the Pi Presents thread

http://www.raspberrypi.org/phpBB3/viewtopic.php?f=38&t=29397on the Raspberry Pi forum to report bugs.

I am keen to improve Pi Presents and your input on real world experiences and requirements would be invaluable to me, both minor tweaks to the existing functionality and major improvements.

## 15 Gotchas and Known Problems

#### When not fullscreen the Pi Presents window is too small or too large

Pending introduction of an options editor edit the following lines in pipresents.py (around line 40).

```
self.nonfull_window_width = 0.6 # proportion of width
self.nonfull_window_height = 0.6 # proportion of height
self.nonfull_window_x = 0 # position of top left corner
self.nonfull_window_y=0 # position of top left corner
```

# When using sudo, autostart, or running from a desktop shortcut my profile is not found.

In any of these situations it is best to use the full path of pipresents and the data home in commands e.g.

sudo python /home/pi/pipresents.py -o /home/pi -p myprofile

#### Pi Presents locks up in full screen, how do I escape.

This is usually caused by Python reporting an exception due to incorrect configuration data.

To avoid this use validation in the editor and try the show, not full screen, and running from a terminal window so you can CTRL-C out if CTRL-BREAK fails. If this fails, try closing the terminal window and if necessary reboot. Pulling the power has potential for corruption, so the ideal solution is to SSH into the Pi from another machine, run top (top -upi) and kill the python process with the k xxxx command. You may need to kill an omxplayer process as well.

#### My video/audio track does not play with Pi Presents

Try playing it using OMXPlayer or MPlayer from the command line.

#### Unclutter does not hide the cursor at all times

Azizar reported that he edited /etc/default/unclutter, adding -grab -noevents

## I have built a gpio input or output device and it is not working with Pi Presents.

There are two stand alone GPIO test programs in the pipresents directoryr input\_test.py and output\_test.py so you can test you I/O before blaming Pi Presents!

#### Permission to write to pp\_log.log is denied.

The log file pp\_log.log is created with the user permissions currently employed. If sudo was used in the command that created the file it is owned by root. Delete the file with user root and then create with user Pi or run pipresents.py without sudo.

Pi Presents sometimes crashes when two audio tracks are being played I have found that if two audio tracks are played with MPlayer and one is set to HDMI and the other to Local then as expected the sound output channel switches. It also causes MPlayer to crash.

# Pi Presents crashes when a video and audio track is played simultaneously.

When the audio track played by MPlayer finishes the Raspberry Pi crashes. Need to check whether this is present in the latest firmware.

# When using the editor on Windows I get the message "failed to save medialist, trying again"

When using Windows the medialist is intermittently not saved the first time. However if you try again it will probably succeed. Ideas on why this happens are welcome. Code is in pp\_medialist.py at around line 266.

#### Pi Presents crashes after playing videos for a few hours

There seems to be some timing problem in the interface with OMXPlayer or with OMXPlayer itself. If a crash happens it's usually best to restart the Raspberry Pi as OMXPlayer seems to be left in a funny state.
